Final Assessment
In Response to Section 402 of WRDA 2000

Final
July 2015
The information presented in this report is to provide a strategic framework of potential options to address problems within the watershed. Options identified will follow normal authorization and budgetary processes of the appropriate agencies. Costs presented were rough order magnitude estimates used for screening purposes only.
This Report was prepared in partnership with:

- The Nature Conservancy
- Mississippi River Corridor
- Lower Mississippi River Conservation Committee
- Audubon

Display of the non-Federal entity logos does not constitute an endorsement by the DOD of NFE products or services.
Executive Summary

Congress authorized the Lower Mississippi River Resource Assessment to examine river management information, habitat, and recreation; identify needs for each of these; and make recommendations for meeting those needs. The Assessment of Information Needed for River-Related Management found that information about sediment and water quality was lacking, data storage and availability need to be better managed, and a better understanding of tributaries would benefit management of the Mississippi River. The Assessment of Natural Resource Habitat Needs found there was a need to better understand water quality, restore the native vegetative mosaic, reconnect secondary channels, manage invasive species, improve the quality of floodplain habitats, inventory river islands, restore main channel habitats, support coastal wetland restoration, and develop plans to comprehensively restore entire river reaches. The Assessment of the Need for River-Related Recreation and Access identified the need for more and better boat ramps, bicycle trails, outfitter and guide services, lodging and dining options, riverside parks, interpretation, riverboat landings and marketing.

This Lower Mississippi River Final Assessment accumulated the needs identified in the previous assessments and found overlap among many of them. In fact most river related recreation is directly related to the natural resources and habitats on the river. This assessment recommends three programs to address the needs on the river. Each of these programs includes multiple studies and projects. The recommendations leverage existing programs and encourage both public and private investment in the river. All recommendations are compatible with navigation and flood risk management.

The recommended Data Information Science and Communications Program would create an interagency center to store and share information, support the ongoing sediment studies, establish a comprehensive water quality monitoring program, conduct studies on tributary watersheds, and complete ecological inventories of river islands and potential natural vegetation. This program would rely on the U.S. Army Corps of Engineers; U.S. Geological Survey; U.S. Fish and Wildlife Service; U.S. Environmental Protection Agency; the states of Illinois, Kentucky, Missouri, Tennessee, Arkansas, Mississippi, and Louisiana; and non-governmental organizations to implement. The program would benefit a variety of habitats and the species that rely on them, recreational users, local economies, navigation, flood risk management, and other river resources.

¹ Costs presented were rough order magnitude estimates used for screening purposes only and are not for authorization or budgetary purposes
The recommended Habitat Restoration and Management Program would support restoration of river reaches, numerous individual aquatic habitat restoration projects, terrestrial habitat restoration, and invasive species management. This program would primarily rely on the U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, and the Lower Mississippi River Conservation Committee with their cooperating agencies, partners and states – Illinois, Kentucky, Missouri, Tennessee, Arkansas, Mississippi, and Louisiana. The program would benefit a variety of habitats and the species that rely on them, recreational users, local economies, and other river resources.

The recommended Recreation Program would support construction of boat ramps, bicycle trails, riverfront parks and riverboat landings; encourage coordinated marketing and interpretation; and entice lodging, dining and outfitter guide businesses. The program would rely on entrepreneurs to provide commercial services, and local community governments and organizations with assistance from the National Park Service to build public infrastructures. The program would benefit recreational users and local economies and would add visibility to all of the other resources of the river.

I. Introduction

This report is the final assessment for the Lower Mississippi River Resource Assessment. It follows three previous reports. The first examined the river to determine the information needed for river-related management. The natural resource habitat needs and the recreation and access needs were examined in the next two reports. This final assessment combines those results and recommends projects and programs to meet the identified needs in concert with the ongoing navigation and flood risk management programs on the Lower Mississippi River. These documents are available at: http://www.mvm.usace.army.mil/Missions/Projects/LMMRA.aspx

The Mississippi River is an American icon. The statistics about the river are impressive: drains all or parts of 31 states and 2 Canadian Provinces; is the third largest watershed in the world overlying one of the three most productive agricultural zones on the planet; provides drinking water for more than 18 million people; transports 62 percent of our Nation’s agricultural output; delivers nearly 400 million tons of coal and petroleum products annually; and directly supports one million jobs. The numbers tell part of the river’s story, but not all.

A thousand years before Christopher Columbus, a new culture arose and spread across the Mississippi Valley and the southeast. The culture was concentrated along the Mississippi River and is now called “Mississippian.” Mississippian Indians included many tribes speaking different languages, but most belonged to either the Caddoan group (west of the river) or the Muskhogean (east). Many other tribes eventually adopted the new way of life. These tribes built hundreds of mounds up and down the river (Lewis & Kneberg 1958). Many of these mound complexes still exist and some are now state parks.

The first European to explore the Mississippi River was Hernando De Soto, who died on its banks in 1542. Jacques Marquette and Louis Jolliet followed in 1673; and in 1682, Robert LaSalle claimed the river for France. France ceded the river to Spain in 1763, but took it back in 1800. In 1803, President Thomas Jefferson purchased the Louisiana Territory from France despite agreeing that the Constitution did not contain provisions for acquiring territory. Jefferson believed the Mississippi River was an important trade route and he wanted to remove France’s influence in the region (Robards 2003).

Control of the Mississippi River was a key military objective of the Union during the Civil War. General Ulysses Grant’s Union forces pushed down from Cairo, IL and up from New Orleans, LA and met at Vicksburg, MS for a six-week siege that ended July 4, 1863. Vicksburg National Cemetery is the largest interment of Civil War dead in the Nation. Port Hudson, LA was the last Confederate controlled fort on the river. The battle at Port Hudson was the longest siege in American history. It took 48 days, for 40,000 Union soldiers to defeat 7,500 Confederates. Shortly after the end of the war, Union soldiers who had been prisoners of war loaded onto the steamboat Sultana to go home. The steamship exploded near Memphis, TN and approximately 1,700 were killed. This tragedy is the largest maritime disaster in U.S. history.

John James Audubon was one of the first to document the incredible diversity of wildlife along the Mississippi River. He spent a great deal of time along the Mississippi River from St. Genevieve, MO to New Orleans. In 1821, he spent only four months at Oakley Plantation near...
St. Francisville, LA but he made 32 bird paintings there. Audubon recognized that the Mississippi River is one of the most diverse river systems in the world and is rich in species and density of fish, birds, mammals, amphibians, reptiles, and invertebrates. Today, scientists know the Mississippi Flyway hosts the world’s largest bird migration, and over 300 species of migrating birds use it.

Mark Twain is probably the best known ambassador of the Mississippi River. Twain grew up along the river and was a riverboat pilot. His *Life on the Mississippi* (1883) and *Huckleberry Finn* (1885) both chronicle life on the Mississippi prior to the Civil War. Although *Huckleberry Finn* was a work of fiction, it placed the Mississippi River into the consciousness of people around the world. Edna Ferber again brought the river to the public’s attention with her 1926 novel *Show Boat* which became the Broadway show of the same name featuring Oscar Hammerstein’s *Ol’ Man River*.

Managing a river as large and powerful as the Mississippi has never been easy. Congress created the Mississippi River Commission in 1879 to advise lawmakers on the needs for flood risk management and navigation. The Federal Mississippi River and Tributaries Project levees, floodwalls, backwaters and floodways form the world’s largest and most comprehensive flood risk management system. Navigation management began in the early 19th century and now Mississippi River commercial shipping is one of the Nation’s valuable assets. On the upper Mississippi River, locks and dams were built to facilitate navigation. These features are not needed below the confluence with the Missouri River.

The Lower Mississippi River (LMR) begins at the confluence of the Mississippi and Ohio Rivers in southern Illinois and meanders southward 954 miles to Head-of-Passes, LA, where the channel subdivides into several distributaries to the Gulf of Mexico. The LMR has two distinct reaches. From the mouth of the Ohio River south to Baton Rouge, LA the river has well-defined point bars and forested floodplains adjacent to the river (Baker et al. 1991). The navigation channel is maintained at a minimum of 9 feet, but is authorized for 12 feet. Below Baton Rouge, the river flows through the Deltaic Plain to the Gulf. The channel is deeper to accommodate ocean-going traffic (45 feet), and there are few meander loops, sandbars, and little floodplain (Baker et al. 1991).

The LMR floodplain is a dynamic freshwater ecosystem that changes with the river’s annual hydrologic regime. The nearly 3 million-acre floodplain is interspersed with abandoned channels, meander scars, and large expanses of forested wetlands. These areas provide a diverse array of aquatic habitat types and are connected to the river at high water. The LMR supports over 90 freshwater fish species and several federally listed threatened or endangered species. People flock to the river to watch birds and other animals.

The Mississippi River is an economic powerhouse for the region. It generates over $150 billion dollars a year in revenues and employs over 580,000 people in the LMR area. Agriculture generates nearly $9 billion a year, navigation generates $4 billion, and river-dependent manufacturing brings $106 billion. Recreation and tourism within the LMR corridor generate nearly $17 billion in annual spending, support thousands of businesses and employ over 240,000 people (IEc & Dziegielewska-Parry 2014).
Interest in the Mississippi River as an economic engine, tourist destination and ecological resource is growing. Government agencies, industries, municipalities and non-governmental organizations are joining forces through America’s Inner Coast Summit, America’s Watershed Initiative, and the Mississippi River Cities and Towns Initiative (MRCTI), to promote the river and highlight its needs. In 2013, the MRCTI signed a Memorandum of Common Purpose with the U.S. Army Corps of Engineers (USACE) with a goal to “perpetuate an era of cooperation and collaboration between the Mayors on the main stem Mississippi River and the U.S. Army Corps of Engineers, to protect, sustain and enhance the natural attributes and economic vitality of the Main Stem Mississippi River.”

The Mississippi River Commission developed a 200-year working vision for the river to insure that people can continue their lives on the Mississippi River. The vision balances the Nation’s needs for security and flood damage reduction with environmental sustainability and recreation, infrastructure and energy, water supply and water quality, and navigation. They committed to five goals for the river to insure its value for future generations. This final assessment builds on these goals and the success of other efforts to manage the Mississippi River.

**Lead secure lives along the river or tributary**

Enjoy fresh air and the surrounding fauna, flora, and forests while hunting, fishing, and recreating.

Travel easily, safely, and affordably.

Drink from and use the abundant waters of any river, stream, or aquifer.

Choose from an abundance of affordable basic goods and essential supplies that are grown, manufactured, and transported along the river to local and world markets.
Congressional Authority

The Lower Mississippi River Resource Assessment (LMRRA) is authorized by Section 402 of the Water Resources Development Act of 2000, Public Law 106-541. It reads:

(a) ASSESSMENTS-The Secretary, in cooperation with the Secretary of the Interior and the States of Arkansas, Illinois, Kentucky, Louisiana, Mississippi, Missouri, and Tennessee, shall undertake for the Lower Mississippi River system--

(1) an assessment of information needed for river-related management;

(2) an assessment of natural resource habitat needs; and

(3) an assessment of the need for river-related recreation and access.

(b) PERIOD- Each assessment referred to in subsection (a) shall be carried out for 2 years.

(c) REPORTS- Before the last day of the second year of an assessment under subsection (a), the Secretary, in cooperation with the Secretary of the Interior and the States of Arkansas, Illinois, Kentucky, Louisiana, Mississippi, Missouri, and Tennessee, shall transmit to Congress a report on the results of the assessment to Congress. The report shall contain recommendations for--

(1) the collection, availability, and use of information needed for river-related management;

(2) the planning, construction, and evaluation of potential restoration, protection, and enhancement measures to meet identified habitat needs; and

(3) potential projects to meet identified river access and recreation needs.

(d) LOWER MISSISSIPPI RIVER SYSTEM DEFINED- In this section, the term 'Lower Mississippi River system' means those river reaches and adjacent floodplains within the Lower Mississippi River alluvial valley having commercial navigation channels on the Mississippi mainstem and tributaries south of Cairo, Illinois, and the Atchafalaya Basin floodway system.

(e) AUTHORIZATION OF APPROPRIATIONS- There is authorized to be appropriated $1,750,000 to carry out this section.
Plan Purpose

The purpose of this final assessment is to develop a strategic approach to managing habitat restoration, recreational opportunities and the information needed to make river management decisions. Historically, the navigation and flood risk management systems have received most of the attention on the LMR. Habitat and recreation have not been managed as systems on the LMR, but planning for these uses is starting to receive focus from many entities.

Goal

The goal of this Final Assessment is to summarize the needs for information, habitat, and recreation identified in the three previous assessments and develop a strategy to meet those needs. The strategy should be holistic and sustainable; reconnect Americans with the great outdoors and the country’s rich legacy of rivers; develop a comprehensive plan for habitat restoration, protection and enhancement; and promote collaboration between the public and private sectors to leverage investments.

Problems

Extensive structural changes on the river’s main stem have disrupted the once dynamic ecosystem. The Mississippi River Levee system has disconnected much of the floodplain from the river. There is less available habitat for threatened and endangered species including interior least tern, pallid sturgeon, and fat pocketbook mussels. The region is underutilized for recreation and underappreciated for its cultural legacy. Additionally, information has not been gathered, stored or analyzed to enable strategic decision-making. The specific problems in the LMR are:

- Data is scattered among diverse government agencies, environmental organizations, industries and institutions.
- There is no integrated knowledge management database or decision support system.
- System-wide assimilation and assessment of data is difficult.
- Although water quality is generally good, localized problems occur and affect some listed species and high nutrient loads contribute to Gulf of Mexico hypoxia.
- Vegetative diversity has been reduced.
- Many side channels, backwaters, and oxbows are disconnected from the main channel.
- Native flora and fauna do not compete well against some invasive species.
- Some gravel bars and sandbars have been lost or degraded.
- The size of the floodplain and the associated habitat has been reduced.
- Mississippi River islands are a unique and limited habitat type, but their ecological importance is not fully understood.
- Coastal wetlands are declining.
- Habitat diversity in the main channel has decreased.
- There is a shortage of motorboat access in some areas.
- Existing access points are not conducive to canoeing and kayaking.
- There are not enough bicycling trails and very few in a natural or rural setting.
- Riverfront access is only available around urban areas.
• There are few interpretative centers/signs and they are scattered.
• There is no “one-stop” organization to provide information for all of the recreational facilities available in the region and market it as a recreational destination.

**Opportunities**

There are opportunities to restore habitat and ecosystem function in the LMR to benefit a variety of species, and to develop a recreation and access plan to improve facilities and promote recreation along this iconic river. There is also an increasing opportunity for public and private collaboration to restore habitat, increase recreation access and promote information sharing. The opportunities vary in different reaches of the river, and not all occur throughout the entire LMR. This final assessment generally recommends further, more in depth studies related to these opportunities. Some of the specific opportunities are:

• Identify the information river managers need to make strategic decisions.
• Compile river-related information and make it accessible.
• Manage water quality in the river better.
• Restore vegetative diversity in the active floodplain.
• Re-connect side channels, backwaters, and floodplain lakes where feasible.
• Promote native species restoration in areas where invasive species have become common.
• Restore and protect sandbars and gravel bars.
• Improve the quality of floodplain habitats.
• Inventory islands to understand their ecological value and develop management plans.
• Restore some habitat diversity in the main channel.
• Provide better motorboat access.
• Provide more canoeing and kayaking access.
• Provide more designated bicycling trails.
• Improve heritage tourism.
• Improve publicly accessible riverfront areas.
• Develop more and better interpretative services and facilities.
• Create informational and marketing materials the public can use to learn about and plan recreational activities.

**Objectives**

These objectives were developed to guide the analyses of needs and lay the foundation for the final assessment.

• Evaluate the information needs of Mississippi River resource managers.
• Identify information gaps that could be filled to better guide LMR projects for the foreseeable future.
• Compile a list of available information that may be of interest to river managers and users now and into the foreseeable future.
• Develop a strategy to make the river data accessible and maintain it for future users.
- Identify habitat needs on the LMR.
- Develop recommendations for habitat restoration studies and programs for the LMR.
- Develop recommendations to foster collaborative habitat management.
- Identify unmet recreation demands in the region.
- Develop recommendations for recreation facilities to meet demands in the region.
- Develop a conceptual strategy to market the region for recreational use.
- Identify mechanisms that will allow public – private partnerships to develop and promote recreational use on the region.

**Study Area**

The study area extends from River Mile 953 of the main stem Mississippi River channel south of Cairo, Illinois, downstream to River Mile 0 (Head of Passes) in Louisiana (see map on page 8). The area encompasses the main river channel and the area between the Mississippi River and Tributaries Project levees or natural high ground (batture), including the mouths of all tributaries between the levees. The study boundary extends up the following rivers and canals that have existing commercial navigation (i.e. commercial barge traffic) to the point of direct influence between each channel and the main stem Mississippi River: the White River upstream to Clarendon, AR; the Arkansas Post Canal upstream to Norrell Lock and Dam, AR; the Yazoo River upstream to Greenwood, MS; the Red River upstream to Lock and Dam No. 2, LA; the Ouachita/Black River upstream to Columbia Lock and Dam, LA; and the Old River from the Old River Lock to its confluence with the Red and Atchafalaya Rivers in Louisiana. For the recreation needs assessment, the study area was expanded to include recreational features and needs related to the Mississippi River that lie beyond the bounds of the active floodplain. The study area includes areas which can or do provide facilities necessary for recreational use along the river. The exact geographic extent is not definitive, but it covers the entirety of the counties touching the active floodplain and the Great River Road National Scenic Byway.

The Atchafalaya Basin Floodway System in Louisiana is also included within the authorized project area. Future public access areas and types of recreation features were already identified in the Atchafalaya Basin Floodway System Master Plan. The plan includes recommendations for public use lands, campgrounds, boat ramps, a visitor center and interpretive trails as well as recommendations for flowage easements, canal closures and water management units. There are ongoing state and Federal programs to manage and improve habitat within the Atchafalaya Basin. USACE has acquired over 350,000 acres in easements and 70,000 acres in fee land within the Atchafalaya Basin to preserve habitat and maintain public access. The State of Louisiana has developed an Atchafalaya Basin Program to oversee the state's Atchafalaya Basin Master Plan that brings together USACE, state agencies, and Basin parishes to protect and enhance the natural resources of the Atchafalaya Basin. Sedimentation in backwater areas is the biggest threat to the conservation of aquatic habitat in the Atchafalaya Basin. As such, restoration activities have mainly focused on sediment management to improve habitat and alleviate poor water quality in backwater areas. These ongoing projects address the needs in the Atchafalaya Basin and no further analysis was done for this study.
Figure 1. Study Area
**Partnership**

The Nature Conservancy (TNC) Great Rivers Partnership is the study cost-sharing sponsor. TNC signed agreements with a group of non-governmental organization partners who are providing work-in-kind study services. The study team includes staff from TNC North America Freshwater Program and TNC State Chapters in Tennessee, Louisiana and Mississippi, Lower Mississippi River Conservation Committee (LMRCC); National Audubon Society; and Mississippi River Corridor-TN. All of these groups focus on sustainable river management and conservation and collectively they represent thousands of river users.

The LMRCC is a coalition of 12 state natural resources conservation and environmental quality agencies from Arkansas, Kentucky, Louisiana, Mississippi, Missouri and Tennessee. It provides the only regional forum dedicated to conserving the natural resources of the Lower Mississippi River floodplain. LMRCC focuses on habitat restoration, landscape level conservation planning, and natural resource-based economic development. The U.S. Fish and Wildlife Service (USFWS) leads the effort and provides a full time coordinator. The U.S. Geological Survey (USGS), USACE, U.S. Environmental Protection Agency (EPA), and U.S. Department of Agriculture Natural Resources Conservation Service (NRCS) are cooperating agencies.

**Public Involvement**

USACE completed multiple public scoping meetings and reviews for this project as mentioned in the summaries of each assessment that follow beginning on page 10. For this Final Assessment, USACE issued a Notice of Availability on 21 April 2015 with a 20 May deadline for receiving comments. Several organizations asked for an extension of the deadline and on 18 May 2015, USACE extended the comment period until 1 June 2015. USACE also held two public meetings, however only three people attended. Appendix D contains all 85 letters received during the public comment process.
II. SUMMARY OF NEEDS ASSESSMENTS

The three LMRRA needs assessments have already been completed. Each assessment identified needs, but did not include any recommendations to meet those needs. The executive summary of each assessment is presented here. The complete documents with references are available for review at: http://www.mvm.usace.army.mil/Missions/Projects/LMMRA.aspx

Assessment of Information Needed for River-Related Management

This assessment began in January 2012. Public scoping meetings were held in Memphis, TN in July 2012, Vicksburg, MS in August 2012 and Baton Rouge, LA in September 2012. The report was released for public comment in June 2013. USACE headquarters concurred with the final assessment in October 2013.

This report assessed information needed for river-related management on the Lower Mississippi River from its confluence with the Ohio River at Cairo, IL to the Head of Passes, LA.

The study team identified issues raised during scoping, examined river management activities, and collated information sources. These steps revealed four areas of information needs for river management. The information needs are related to sediment, water quality, data storage and availability, and tributary management.

Many of the world’s great rivers have sediment monitoring and management plans, but there is not one for the Mississippi River. Sediment is both a management problem and a valuable asset in the river. Sediment monitoring has not been done consistently on the Lower River. A systematic monitoring and measuring protocol and the development of predictive sediment models would give river managers the tools to develop a sediment management plan. This would benefit flood risk management, navigation, fish and wildlife, coastal habitat, water supplies and Gulf of Mexico hypoxia.

Clean water is vital to the nation’s economy. Water quality in the Mississippi River is generally good and continues to improve, but monitoring is not well coordinated among the seven states along the Lower River. The sources and fates of nutrients, pathogens and contaminants in the river have not been clearly delineated. A coordinated water monitoring and analysis program for the river and tributaries would give managers the tools to make informed decisions and develop comprehensive management plans to continue improving water quality. This would benefit fish and wildlife, recreation, water supplies, coastal habitat and Gulf of Mexico hypoxia.

Data availability is important for all river management. Much of the data for the Lower River is held in agency files and databases. A substantial amount of historic data only exists as paper files and maps that can only be accessed in person. River managers either make decisions without some information or invest resources to generate information that may already exist. A centralized data management system that stores some information and provides linkages to the rest would give river managers and the public access to the best information available. This is vital to improved management of water quality and sediment.

Tributaries are some of the most significant sources of nutrients and sediment to the main-stem of the Lower Mississippi River. There has been very little geomorphic analysis of tributary
streams to better understand how they interact with the river. Comprehensive watershed management will be a necessary part of enhanced water quality and sediment monitoring programs and tributary river restoration. It is important for water quality, sediment, hypoxia, habitat, and fish and wildlife management.

**Assessment of Natural Resource Habitat Needs**

This assessment began in July 2013. Public scoping meetings for both the natural resource habitat and recreation assessments were held in Dyersburg, TN in July 2013, and Helena, AR and St. Francisville, LA in August 2013. The report was released for public comment in November 2014. HQUSACE concurred with the final assessment in April 2015.

This report assessed the natural resource habitat needs for the Lower Mississippi River from its confluence with the Ohio River at Cairo, IL to the Head of Passes, LA.

The Mississippi River and the land between the levees are a dynamic ecosystem that changes markedly in response to the river’s annual hydrologic regime. The nearly 3 million-acre floodplain is interspersed with abandoned channels, meander scars, and large expanses of forested wetlands. These areas provide a diverse array of aquatic and terrestrial habitat types.

The Mississippi Flyway hosts the world’s largest bird migration, connecting life from the Arctic to South America. Over 300 species of migrating birds and approximately 70% of the Nation’s migratory waterfowl use the flyway. The river also supports over 90 freshwater fish species.

This assessment found nine areas of habitat needs on the Lower River and identified several plans that have already been developed to answer some of these needs.

The Mississippi River receives water from 31 states. The water contains many contaminants and nutrients. Water quality is not a major limiting factor in the river ecosystem, but there is very little information about localized water quality effects, especially in backwaters, and side channels. There is a need to better understand water quality in secondary and tertiary habitats that are important for some life stages of fish and mussels.

The need to restore bottomland hardwood in the Lower Mississippi River Valley has long been recognized and is a priority for many entities, but other vegetation types have also declined. There is a need for research to examine current hydrology, soils and historic vegetation within the batture and develop tools to direct restoration species selection. This information would increase the success of restoration efforts. There is also a need to control or eliminate invasive plant species where they threaten restoration or preservation efforts.

There is a need to reconnect backwaters, side channels and floodplain lakes with the main channel at normal water levels. The Restoring America’s Greatest River Initiative identifies specific opportunities for restoring some of this habitat. The federally listed interior least tern, pallid sturgeon, fat pocketbook mussel, and many other species in the Lower Mississippi River would benefit.
Most of the species native to the Lower Mississippi River are still present and their populations are viable, but the species abundance of many has declined. Habitat changes along the main stem and up the tributaries have caused most of the changes for mammals and birds, but the main factor driving aquatic population changes has been the introduction of exotic aquatic species such as carp and zebra mussel. There is a need for comprehensive studies of tributaries to understand their habitat value to the overall Lower Mississippi River system and there is also a need to control invasive species especially where they threaten native species.

Dynamic river forces form, enlarge, erode, move, and destroy sandbars and gravel bars. On established sandbars, high water removes existing vegetation and deposits new sand. Sandbars are the primary habitat component used for interior least tern nesting. Gravel bar habitats are important as spawning substrate for pallid sturgeon and other fish species. There is a need to protect and restore gravel and sand bars. The Conservation Plan for the Interior Least Tern, Pallid Sturgeon, and Fat Pocketbook Mussel addresses management and restoration of these features and the Restoring America’s Greatest River initiative also identifies the need to conserve and restore them.

The Mississippi River active floodplain is now 80% smaller than it was historically (Baker et al 1991). The decrease in area inundated impacts water quality, habitat and species. The floodplains of tributary rivers may have become more important since the Mississippi River floodplain has been reduced. Cities, farms, highways, factories and other developments have moved into the historic floodplain. There is a need to assess tributary rivers to determine how their floodplains can be better managed to compensate for some of the loss of floodplain area. On the main stem Mississippi River, there is a need to restore the quality of habitat within the batture.

Many Mississippi River islands have been lost or altered. Islands offer important edge habitat. Since the islands are isolated from the bank, they afford many species safe places for sensitive life cycle events such as nesting. There is a need for an ecological inventory of islands in the LMR to determine their value for habitat and potential for restoration.

Preserving and rebuilding coastal wetlands is a recognized need and projects and programs are in place to address the problems. *Louisiana’s Comprehensive Master Plan for a Sustainable Coast* sets forth a long term plan to address coastal needs in that state.

Habitat in the Mississippi River main channel was once very diverse, and provided a variety of substrates and flow conditions. Habitat complexity in the main stem has been reduced. Fish species, such as pallid sturgeon, primarily use the main channel of the river and rely on the diverse habitats for their various life stages. There is a need to restore some of the diversity in the main channel of the Mississippi River where it is compatible with navigation.

The Mississippi River ecosystem is a dynamic system with interactions between the terrestrial and aquatic systems, main channel and side channel areas, mudflats, backwaters, tributaries and islands. There is a need to examine the Mississippi River and batture at an ecologically meaningful scale. There are some priority reaches of the river where there are opportunities to enhance a broad spectrum of features, i.e. restorable side channels, backwaters, and oxbows, a
wide floodplain, large islands, populations of threatened and endangered species and sand bars. These areas should be examined holistically to develop plans for restoring all of the vital ecological elements.

**Assessment of River Related Recreation and Access Needs**

This assessment began in March 2013. Public scoping meetings for both the natural resource habitat and recreation assessments were held in Dyersburg, TN in July 2013 and Helena, AR and St. Francisville, LA in August 2013. The report was released for public comment in July 2014. HQUSACE concurred with the final assessment in December 2014.

This report assessed the need for river-related recreation and access on the Lower Mississippi River from its confluence with the Ohio River at Cairo, IL to the Head of Passes, LA.

More than 140 million Americans participate in outdoor recreational activities. The outdoor recreation industry supports 6.1 million American jobs and generates $646 billion in spending each year. In the Lower Mississippi River Region, outdoor recreation and tourism combine to generate nearly $17 billion annually and over 240,000 jobs (Yellowwood 2013).

The study team identified eight areas of need on the Lower River: boat ramps, bicycle trails, outfitter and guide services, lodging and dining, parks and vistas, interpretation, riverboat landings and marketing. Addressing some of the recreation and access needs on the Lower River would add to residents’ quality of life, and bring increased revenues and jobs to the region and the nation.

Fishing and paddling generate nearly 900,000 American jobs and $9 billion in Federal and state tax revenues annually. The biggest obstacle to expanding fishing and paddling use of the Lower Mississippi River is the lack of well located boat ramps. There are only 129 boat ramps along the 954 miles of the Lower Mississippi River. Many ramps were designed for large boats and are not safe for small craft.

More than 60 million Americans ride bicycles. Bicycling generates 1.1 million American jobs, and $81 billion in annual spending. Cities are designating more bicycle lanes in urban areas and the public would like to link these urban systems to trails in more rural settings with less traffic.

Outfitter and guide services in the Lower Mississippi River Region can provide safe, convenient options for people who want to hunt, fish, paddle and bicycle. The services are very limited but the increasing popularity of paddling and bicycling along with hunting and fishing create a good opportunity for small businesses all along the River.

Lodging and dining are readily available in urban areas, but are lacking in rural areas. Long distance bicyclists and paddlers, hunters and fishermen, and families visiting cultural and historic sites could all use more lodging and dining options in rural areas.

Many of the small towns on the Lower Mississippi River have no public space along the riverfront for picnics or even good views of the River. The topography of the Lower River limits the number of natural vistas providing broad views of the River and some of the places that could provide a view are not accessible. Riverside parks are excellent areas for interpretive
centers that tell the story of the River and its habitat, value for navigation, and flood risk management system.

Riverboats are making a comeback on the Mississippi River. The boats dock at small towns and big cities along the length of the River and offer excursions to see cultural and historic sites, participate in local activities, and take guided trips into natural areas. Many small towns do not have adequate docking facilities and miss the revenue from riverboat visits when the River is too high or too low.

The Lower Mississippi River passes seven states and many cities. There are many opportunities for outdoor recreation and tourism, but there is no single entity marketing the Mississippi River for tourism. Many visitors to the region come for a single purpose and are unaware of other opportunities.
III. CUMULATIVE CONCLUSIONS

The three needs assessments were narrowly focused, and each one identified needs specific to that focus. Most of the identified needs touch on other needs, and there are interactions among them. This section describes each need, which assessments identified it, what other needs it interacts with and the benefits of addressing the need. The next section of the report includes recommendations to meet the needs. Plans that are already in place to address the needs are also described.

Water Quality

All three assessments identified a need for better water quality monitoring and management. This need is related to sediment, data management, tributary management, vegetative mosaic, side channel, faunal community, floodplain, coastal wetland, main channel habitat, interpretation, marketing, and safety issues.

Water quality regulations were set forth in the Clean Water Act of 1972. The EPA delegates most of the responsibility for enforcing the Act to the individual states. Each state has broken the Mississippi River into segments and designated uses for each segment. Water quality standards are set to protect the existing and designated uses. The states conduct water quality monitoring and periodically report the compliance status of the water quality standards. Not all of the states conduct monitoring on the LMR. The Clean Water Act spurred more water quality monitoring for the LMR, but there is still no comprehensive monitoring program. A centralized data repository would be necessary to support a comprehensive program.

Nutrients and contaminants enter the Mississippi River from both point and non-point sources including air deposition. Contaminants are sometimes bound with sediment. There are storm sewer systems, industrial discharges, and agricultural runoff. Contaminated water affects fish and amphibians, requires more treatment for drinking water, and carries human pathogens. Endangered pallid sturgeon are long-lived fish and contaminants can bioaccumulate in them even if the contaminant levels in the water are moderate to low. Recent studies point to this as one cause for sturgeon decline (Divers et al. 2009, USFWS 2009, Blevins 2011, Schrey et al. 2011).

Excess nutrients lower dissolved oxygen and cause eutrophication in side channels and oxbows. Nutrients attenuate as the river spreads out over the floodplain, but the floodplain area is now over 80% smaller than it was historically (Baker et al. 1991). Research indicates most of the excess nutrients are coming from the upper and middle river; but reforestation in the batture and restoration of side channels and backwaters could attenuate some nutrients, reduce hypoxia, and improve overall water quality. Tributary watersheds are nutrient and contaminant sources and must be addressed to improve water quality in the river.

Water quality is an important aquatic habitat variable in the LMR (Baker et al. 1991). Low oxygen levels impact fish species richness and abundance in river backwater areas, river channels, and lakes (Killgore & Hoover 2001). There are localized problems such as chemical spills or instances of low dissolved oxygen in backwaters or harbors that kill fish, but there is very little documentation of these events.
Coastal wetlands and the hypoxic zone in the Gulf of Mexico are outside the study area, but they are dependent on Mississippi River water. The LMR collects and transports water, sediment and nutrients from the entire Mississippi River watershed to the Gulf of Mexico. Some of the water and sediment is diverted to replenish coastal wetlands, but levees direct most of it out to deeper water. The hypoxic zone forms in the northern gulf every summer. It has been as large as 5.5 million acres. Hypoxic conditions stress and kill bottom-dwelling organisms and drive fish from the area (EPA 2007, MRGOWNTF 2008, Bianchi et al. 2010, Kroger et al. 2012).

Although water quality in the Mississippi River is relatively good and steadily improving, for example total nitrogen has decreased from its high in 1990 (Turner et al. 2007), the general public perception is that water quality in the river remains poor. The combination of nutrients and contaminants can lead to changes in water color and odor that can be off-putting to recreational users. Conflicting advisories on fish consumption add to the public’s misperception. There are public concerns about the safety of water contact while fishing or paddling on the river. Marketing and interpretative tools are needed to address public concerns and promote the Mississippi River for recreation.

Improving water quality monitoring and management would benefit fish and wildlife, fishermen, paddlers, municipal water supplies, industries and others who rely on the Mississippi River for clean water. Clean water is vital to the economy of the nation and the quality of life in the Lower Mississippi River Valley.

Delivering water and treating wastewater is an energy-intensive effort. The water is treated, pumped to homes and businesses, and pumped to wastewater facilities to be treated again. The water supply and sewerage industry generates an estimated $385 million in annual revenue (IEc & Dziegielewska-Parry 2014).

The Mississippi River/Gulf of Mexico Watershed Nutrient Task Force was established in 1997 to understand the causes and effects of eutrophication in the Gulf of Mexico; coordinate activities to reduce the size, severity, and duration of the hypoxia; and ameliorate its effects. The Task Force includes five Federal agencies – USACE, USDA, Department of the Interior, EPA, and National Oceanic and Atmospheric Administration – twelve states, and the National Tribal Water Council. The primary priority of the Federal agencies is to provide broad support to the development and implementation of the state prepared nutrient reduction strategies.

The Task Force has identified five priorities: 1) monitoring to demonstrate water quality progress; 2) in-basin and Gulf modeling to demonstrate water quality progress; 3) regulatory program activities; 4) outreach, education, and initiatives; and 5) innovation to expand partnerships and technical assistance. A variety of programs and tools are being used and improved to accomplish these priorities.
Sediment

The information and habitat assessments identified a need for better sediment monitoring and management. This need is related to water quality, data management, tributary management, sandbar, floodplain, and coastal wetland issues. A centralized data repository would be necessary to support a comprehensive program. Tributary watersheds are nutrient and contaminant sources and must be addressed to manage sediment in the river.

Prior to the 1930’s, most of the sediment in the Mississippi River came from caving banks and was stored primarily within the channel as sandbars and regular sediment input maintained coastal wetlands. Since that time, revetments have reduced bank caving limiting sediment input. Dikes now trap much of the bedload and levees limit the overbank areas (Kesel 2003). Sandbars are now rarer, and there is less sediment available to replenish coastal wetlands.

Sediment management is a vital and costly endeavor on the LMR. USACE spends up to $170 million annually dredging sediment in the Lower Mississippi River to maintain navigation. Louisiana’s Comprehensive Master Plan for a Sustainable Coast calls for more than $25 billion to be spent on a variety of projects, most involving water and sediment management.

Understanding sediment dynamics is important for river management. Sediment management plans are in place for many of the world’s great rivers: the Rhine (Europe), the Blue Nile (Africa), the Yangtze (Asia), the Columbia (North America), and the Darling (Australia). These plans benefit coastal areas, navigation, hydropower, and land conservation around the world.

Data Storage and Availability

The information assessment identified the need for a data management program to capture, store and make available all of the existing and future data for the LMR. The habitat assessment noted the need for more research and public education on several topics, and a central information system would respond to that need. The recreation assessment found there was a need for public education about the river, better interpretative facilities, a comprehensive marketing program, and safety information. When taken together, these conclusions point to the need for a public facility to house scientific, social, commercial, historical and other information about the river. The center needs to have the ability to support outreach programs and promote the LMR for research, tourism, outdoor recreation, and a variety of other uses.
Tributary Management

All three assessments identified a need to understand and manage the tributaries that provide water, sediment, fish, habitat, and recreational access to the river. There are over forty tributary watersheds to the LMR that are large enough to have significant impacts on the river. Tributary management is related to sediment, water quality, faunal community, floodplain, boat ramp, and bicycle trail issues. The sheer size of the Mississippi River presents a management challenge to state and Federal agencies. Tributaries cross fewer state boundaries than the main stem river and are a manageable scale for comprehensive assessments.

A majority of LMR tributaries have been altered to facilitate drainage (Benz & Collins 1997). Channelization has reduced or eliminated natural stream functions in many tributary systems. These functions include but are not limited to providing habitat for freshwater mussels, crayfish, fish, amphibians, reptiles, mammals, and birds. Studies have documented population declines to all of these resources as a result of habitat loss (Benz & Collins 1997). Channelization in tributary rivers has also altered geomorphology and changed sediment dynamics.

During storm events, rain is quickly drained from the floodplain and the timing and duration of flood pulses in the tributary rivers have changed (Baker et al. 2004). Nutrients have less opportunity to attenuate on the floodplain. Tributary rivers are important habitats for fish and mussels, and the watersheds contain forested patches. Conversion of forests to crop lands has disconnected forest patches and altered biotic community structure and function, but there are opportunities to increase habitat connectivity between the river and some of the larger tributaries.

The Mississippi River also exerts an influence on tributaries, and many experience some backwater flooding. Changes in the Mississippi River can cause aggradation or degradation in the tributary channels (Biedenharn et al. 2000).

Tributary rivers provide opportunities to meet recreation demands. They offer calm areas to launch canoes, kayaks, and small fishing boats. Bicycle trails within the tributary watersheds would be a valuable addition to the overall network of trails and could provide access points to the planned Big River Parkway bicycle trail.

Vegetative Mosaic

The habitat assessment identified the need to conduct a potential natural vegetation study and use the results to maintain and reestablish the vegetative mosaic within the batture. The information and habitat assessments both noted the value of native vegetation in attenuating nutrients. The recreation assessment acknowledged that the diverse habitats in the batture supported exceptional, year-round wildlife watching. The vegetative mosaic in the LMR is related to side channel, faunal community, floodplain, and outfitter and guide issues.

Historically, a variety of vegetative communities was interspersed throughout the floodplain. The soil and hydrologic regime influenced what species occurred in any given area. Bottomland hardwoods (oak, hickory, pecan, tupelo, bald cypress, et al.) were the most common species in the floodplain, but softwoods (cottonwood, elm, ash, hackberry, et al.) were also present. Forest
types included cypress-tupelo, cottonwood-willow-sycamore, white oak-red-oak-hickory, hackberry-elm-ash, and many others (Klimas 1988, Stanturf et al. 2000, Gardiner et al. 2005). Drastic vegetation changes began after the levee system was complete and soybean prices rose in the 1950’s. Between the 1950’s and 1970’s, nearly 300,000 acres were cleared and converted to agriculture every year (King et al. 2006).

Threatened Louisiana black bears depend on large, complex forest structure for forage, nesting or bedding sites, and successful reproduction (USFWS 1995). The flood prone forest species that now dominate the batture are less complex and not as suitable for black bear. Reptiles, amphibians, and many mammals, including the Indiana and gray bats, also depend on bottomland hardwood forests for cover, food, and successful reproduction. Forest interior song birds are dependent upon large expanses of bottomland hardwood forests. Fragmentation, human disturbances, and high edge to area ratios are causing songbird populations to decline (Twedt et al. 2002, Twedt et al. 2008). Game species that depend on diversity of habitat include white-tailed deer, wild turkey, squirrel, rabbit, and many species of waterfowl (LMVJV 2012). Many species, like American woodcock, rely on the early successional stages of bottomland hardwoods (Kelley et al. 2008).

River cane or giant cane was once common in the valley, but approximately 98% of this ecosystem has been lost throughout its range to agriculture, altered fire regimes, altered flood regimes, and grazing (Brantley & Platt 2001). Canebrakes are prime habitat for several species including the Louisiana black bear, Swainson’s warblers, and several species of butterflies are also known as cane obligates (Platt & Brantley 1997, Brantley & Platt 2001, Hendershott 2002, LMVJV 2007).

The floodplain of the LMR has emergent, floating, and submersed aquatic vegetation, but their occurrence and distribution is dependent on the flow regime and elevation relative to the main stem river. Areas near the main channel are usually devoid of vegetation due to the scouring effect of moving water, except for duckweed that can become abundant after early isolation from the river. Submersed aquatic vegetation occurs in waterbodies furthest removed from the main stem river, such as borrow pits (personal communication, Dr. Jack Killgore, ERDC).

Invasive plant species pose a serious risk to native species. Kudzu was first introduced to the U.S. in 1876, and the erosion control programs of the 1930’s to 1950’s caused its spread. It now covers 2 million acres of forest land in the southern United States (Forseth & Innis 2004). Kudzu is an aggressive, fast growing vine and is very heavy. It covers other plants blocking out sunlight, girdling stems, breaking branches and even uprooting trees (Forseth & Innis 2004, NPS 2010). Privet was introduced to the U.S. in the mid-19th century as an ornamental shrub. It has invaded many areas in the LMR that are now drier than they were historically. It crowds out native understory vegetation (Merriam & Feil 2002). Neither of these plants provides suitable habitat for native species.

The diverse habitats in the valley support valuable recreational activities. In 2011, nearly 72 million people 16 years old or older spent about $55 billion on wildlife watching. There are 46.7 million bird watchers. Waterfowl, raptors, and songbirds attract the most interest. In 2011, hunting trips accounted for 22% of all outdoor recreation trips in the region. There are nearly 14
million hunters in the United States and they spend over $30 billion every year (USDI 2011) and generate 323,000 American jobs (Yellow Wood 2013). There are 8.3 million hunting trips taken in the area each year (IEc & Dziegielewksa-Parry 2014).

The Lower Mississippi Valley Joint Venture (LMVJV) is a self-directed, non-regulatory private, state, and federal conservation partnership. LMVJV’s goal is sustaining bird populations and their habitats within the Lower Mississippi Valley and West Gulf Coastal Plain regions. They implement and communicate the goals and objectives of relevant national and international bird conservation plans (LMVJV 2002). The Lower Mississippi Valley Joint Venture Plan was formulated to address problems that traditionally confronted wetland conservation in the region; namely, clearing of forests for agriculture and extensive alterations of wetland hydrology resulting from basin-wide flood control and drainage.

The NRCS provides technical and financial assistance to landowners for water quality and wetlands improvement projects. NRCS has established the Mississippi River Basin Healthy Watersheds Initiative to improve the health of the Mississippi River Basin. Through this Initiative, NRCS and its partners help producers in selected watersheds in the Mississippi River Basin voluntarily implement conservation practices that avoid, control, and trap nutrient runoff; improve wildlife habitat; and maintain agricultural productivity. They plan to restore over 11,000 acres of wetland habitat and prevent sediment and nutrients from entering waterways, decrease flooding, and improve bird and fish habitat. Approximately two thirds of the work is within the batture. The Wetlands Reserve Enhancement Program, part of the agency's Wetlands Reserve Program, provides the funding. Between 2010 and 2013, the NRCS formalized agreements with 47 landowners in the basin, investing $17.8 million in long-term conservation easements and wetland restoration projects.

**Side Channels, Backwaters and Oxbows**

The habitat assessment identified the need to restore side channels, backwaters and oxbows. The recreation assessment noted that these areas are good places for boat ramps. Side channel, backwater, and oxbow needs are related to water quality, vegetative mosaic, faunal community, boat ramp, outfitter and guide, and safety issues.

Historically, the Mississippi River meandered across the alluvial floodplain forming cut-offs and secondary channels. Secondary channels were gained and lost as the river formed new courses to the Gulf of Mexico (Williams & Clouse 2003). Levees, revetment, and dikes have stabilized the river and limited the formation of new secondary channels. Secondary channels have become a finite resource. Sedimentation and loss of connectivity with the main channel continue to reduce the quality and quantity of side channels (Guntren et al. 2012, Killgore et al. 2012, USACE 2013). The total number of secondary channels in the LMR depends on river stage. At high discharge, water moves laterally and reconnects numerous secondary or tertiary channels that are dry at lower stages.

Floodplain waterbodies are not connected to the channel when it is confined below banks. During low-water, secondary channels may remain connected to the main channel. At low water, fish and other aquatic fauna may be confined to the main channel where deep water and
High velocities can impair survival and growth. Secondary channels offer greater habitat diversity compared to the main channel (Killgore 2012, USACE 2013). Secondary channels function similarly to both main channel and floodplain habitats. There are areas of strong current with substrates of sand and gravel, and other areas of slackwater with connections to backwaters and lakes. Flowing water supports fishes such as suckers, minnows, and darters that are relatively intolerant to habitat changes. Overall habitat heterogeneity in secondary channels supports a diverse assemblage of invertebrates and fishes and contributes to the overall health of the aquatic system (Baker et al. 1991, Simons et al. 2001).

Dense alluvial clays dominate in these backwater areas that historically supported extensive wetlands. Natural levees form along the banks of the LMR. The riverbank can be 10 to 15 feet higher than the lowlands farther back from the river. Because of these natural levees, drainage within the floodplain, frequently flows away from the Mississippi River to lower elevations near the valley walls, except near tributary confluences (Kleiss et al. 2000). Slackwater areas, access to backwaters, structurally complex riverbanks, and other habitats are important for biotic integrity of aquatic communities (Killgore 2012, USACE 2013).

The endangered fat pocketbook mussel was probably common in oxbows and sloughs (Miller & Payne 2005). In the LMR, mussels are found in a mixture of sand, silt, and mud substrates in side channels (USFWS 2012). Backwaters provide nursery areas for fishes (Parmalee 1967, Harris & Gordon 1987, USFWS 1989, Harris & Gordon 1990, Watters et al. 2009, USFWS 2012). Many oxbow lakes are now outside of the levee system and turbidity, sedimentation, water quality, and land use impact habitat quality (Miranda & Lucas 2004).

Secondary channels support fishing, paddling, hunting and bird watching. There are 33 million anglers in the U.S., and they spend around 550 million days fishing annually. Anglers spend over $40 billion every year (USDI 2011) and support nearly 600,000 American jobs (Yellow Wood 2013). Between 2006 and 2011, the popularity of fishing rose 3%. Fishing is popular across all demographic groups – ethnicity, age, gender, and education levels. There are 1 million anglers over the age of 75. Fishing accounts for 67% of the outdoor recreational activity in the region (USDI 2011).

The LMRCC developed and continues to update the Restoring America’s Greatest River (RAGR) initiative. RAGR is a plan to implement aquatic habitat restoration and river-access improvement projects within the river’s active floodplain from Cairo to the Gulf of Mexico. LMRCC and its partners have identified projects to address side channels, backwaters and oxbows, sand and gravel bars, islands, and main channel habitat. LMRCC has implemented 14 projects since 2006 with cooperation from USACE, USFWS, state agencies, and the Mississippi River Trust. These projects have restored flow to 56 miles and thousands of acres of side channel habitat. These projects are valuable to pallid sturgeon, fat pocketbook mussels, interior least terns, and many other species.
Invasive Species

The habitat assessment identified a need to manage native species and control invasive species. The recreation assessment noted the importance of these species for hunting, fishing and wildlife watching. The needs for faunal communities are related to water quality, data management, tributary management, vegetative mosaic, floodplain, sandbar, island, outfitter and guide, boat ramp, interpretation, and marketing issues.

Habitat changes have affected the relative abundance of native species in the LMR. Habitat changes have driven most of the population changes for birds and mammals, but the introduction of invasive species has caused significant impacts to native aquatic species. A variety of exotic aquatic species are established in the LMR. These species disrupt native species assemblages. Predation or competition with exotic species jeopardizes almost half of the species listed as threatened or endangered in the U.S. (ANSTF 2012).

Common carp were introduced in the early 20th century and have become so well established that they are often overlooked in discussions of invasive species. The four more recently introduced carp species (bighead, black, silver, and grass) garner most of the attention and management focus, but all of the carp species have had negative impacts on native fishes (Conover et al. 2007). Bighead carp adversely impact mussels, larval fish, and several adult fishes such as gizzard shad, bigmouth buffalo, and paddlefish. Black carp pose a threat to many of the remaining populations of federally listed threatened and endangered mussels. Competition between black carp and native freshwater drum, the host for the endangered fat pocketbook mussel, is significant (Conover et al. 2007). Grass carp prefer a diet of submerged plants with soft leaves, but will also consume detritus, insects, small fish, earthworms, and other invertebrates. Grass carp can damage native aquatic vegetation. Silver carp lack a true stomach so they feed almost continuously and competition with native planktivores is a major concern (Conover et al. 2007, Fuller 2013a). The carp are also hazardous to boaters because they jump out of the water in response to boats. Northern snakeheads are not known to be in the Mississippi River, but they have been found in the White River, AR and have potential to spread.

Zebra mussels are very prolific and can reach high population densities (MDC 2007, Fuller 2013b). They can reduce the density of phytoplankton, which is food for many native fish and mussels. An estimated $200 million is spent annually to maintain intake pipes and screens that become clogged with zebra mussels (MDC 2007, Fuller 2013b).

The U.S. Congress passed the Nonindigenous Aquatic Nuisance Prevention and Control Act in 1990 to establish a broad national program to stop the introduction of nuisance species and control the spread of species already present. This legislation was reauthorized and expanded when the National Invasive Species Act was enacted in 1996 (ANSTF 2012). The Aquatic Nuisance Species Task Force (ANSTF) comprised of 13 Federal agencies and 13 ex-officio representatives (i.e., Mississippi Interstate Cooperative Resources Association or MICRA) is devoted to preventing and controlling aquatic invasive species (ANSTF 2012). The ANSTF Strategic Plan 2013-2017 focuses on prevention, monitoring, and control of aquatic nuisance species, and increasing public awareness of aquatic invasive species and their impacts (ANSTF 2012). Controlling nuisance species is primarily achieved through prevention, early detection,
and rapid response. Public education, awareness, and collaboration are vitally important to control aquatic nuisance species.

**Sandbars and Gravel Bars**

The habitat assessment identified the need to manage sandbars primarily for the benefit of the federally listed endangered least tern, but they also benefit pallid sturgeons. The needs for sandbars are related to sediment, faunal community, and side channel issues.

Gravel bar habitats are important as spawning substrate for pallid sturgeon as well as other fish species. Sandbars generally are dynamic features of the natural river landscape. Dynamic river forces form, enlarge, erode, move, and destroy sandbars. On established sandbars, high water removes existing vegetation and deposits new sand. Properly deposited dredged material can also create sandbars.

Sandbars are the primary nesting habitat for endangered interior least tern. When sandbars become fully vegetated, terns will not use them (Thompson et al. 1997). Flooding can scour vegetation from sandbars and convert them to suitable nesting habitat. If perennial woody vegetation becomes well-established and high flows can no longer remove vegetation, sandbars succeed to forest and permanently lose nesting value (Sidle et al. 1992, Friedman et al. 1998, Johnson 2000, Leslie et al. 2000, Wiley & Lott 2012). Terns do not nest in proximity to tall vegetation or other high features, or where channels become narrow (Jorgensen et al. 2012, USACE 2011).

USACE and USFWS worked together to develop the *Conservation Plan for the Interior Least Tern, Pallid Sturgeon, and Fat Pocketbook Mussel in the Lower Mississippi River (Endangered Species Act, Section 7(a)(1))*. The Endangered Species Act requires Federal agencies to use their authorities as appropriate to carry out programs for the conservation and recovery of endangered and threatened species. USACE, USFWS, and state conservation agencies identified issues associated with USACE flood risk management and navigation projects on the LMR. These projects have caused the most significant impacts to the river, but offer the best, most cost-effective tools to address these issues. USACE will incorporate ecological engineering concepts in the design of channel improvement and channel maintenance projects. This should provide localized improvements in habitat function and value, with little to no effect on flood risk management, navigation, or project cost. USACE will continue to partner with other agencies to implement cost-effective secondary channel restoration where possible. These actions have already benefitted endangered species habitat in the channel. This plan describes the programmatic mechanisms USACE can use to implement recovery and conservation measures in the Channel Improvement Program of the Mississippi River and Tributaries project.

**Floodplain**

The habitat assessment noted the importance of floodplain habitats for a variety of species. The needs for the floodplain are related to sediment, water quality, tributary management, vegetative mosaic, side channel, and faunal community issues.
The LMR floodplain provides valuable habitat for waterfowl, resident fish, river fish, and other wetland and other species, such as freshwater mussels. Floodplain connectivity is important for fish, aquatic insects, mussels, turtles, birds, and mammals (Winemiller 2003). The construction of the Mississippi River levee system altered natural patterns of surface water drainage within the region and reduced the floodplain area over 80% (Baker et al. 1991). Fish and other aquatic species no longer have access to millions of acres of foraging, spawning, and nursery habitat. Mississippi River water no longer spreads out over the historic floodplain. There is less opportunity for nutrients to attenuate and for water to percolate through the soil (Winemiller 2003). Wetland quantity and quality has been reduced in the region.

The remaining floodplain with its backwater areas is a dynamic freshwater ecosystem. The active LMR floodplain varies in width from 1 to 15 miles. The nearly 3 million-acre floodplain is interspersed with abandoned channels, meander scars, borrow pits, and large expanses of forested wetlands, and tributary mouths (Baker et al. 1991). These areas provide a diverse array of aquatic habitat types and are connected to the river at high water. Flooding is necessary about once every two years to maintain populations of some fish and lack of flooding may result in successive reproductive failures (Barko et al. 2006). Changes in timing and extent of flooded acreage affect migratory waterfowl and shorebirds. The floodplain, at high water, provides nutrition, secure roosting, cover in inclement weather, loafing sites, protection from predators, and isolation for pair formation.

The floodplains of tributary rivers may have become more important since the Mississippi River floodplain has been reduced. Cities, farms, highways, factories, and other developments have moved into the historic floodplain. Opportunities to restore land to the floodplain will likely be rare and small scale. On the main stem Mississippi River, restoration efforts should focus on restoring the quality of habitat within the batture as discussed in the vegetative mosaic and side channels, backwaters and oxbows sections.

Islands

The habitat assessment identified the need to inventory islands to determine their ecological value. Islands are related to data management, vegetative mosaic, side channel, and faunal community issues.

Mississippi River islands are unique habitats. Islands afford many species safe places for sensitive life cycle events such as nesting. There is a need for an ecological inventory of islands in the LMR to determine their value for habitat and potential for restoration. At least two Mississippi River islands have been offered for sale in the last two years. State, federal or non-governmental conservation organizations have shown some interest in acquiring these, but there is not enough information about their ecological value.

RAGR includes some island conservation opportunities.
Coastal Wetlands

Although coastal wetlands are dependent on fresh water and sediment from the river, they are outside of the project area, and this report includes no recommendation for them. Any program to manage water quality and better understand sediment will benefit coastal management. Preserving and rebuilding coastal wetlands is a recognized need. Congress authorized the Louisiana Coastal Area program in 2007 and Louisiana’s Comprehensive Master Plan for a Sustainable Coast sets forth a long term plan to address coastal needs.

Main Channel Habitat

The habitat assessment identified a need to provide some habitat diversity in the main channel. The recreation assessment mentioned the popularity of fishing and boating in the channel and the safety concerns associated with it. The main channel needs are related to sediment, water quality, tributary management, side channel, sandbar, island, outfitter and guide, boat ramp, riverboat landings, and safety issues.

Habitat in the main stem of the Mississippi River is less diverse than it was historically. Channel cut-offs reduced the number of bendways, which shortened the river causing a major loss in channel habitat including pointbars and gravel bars. Dike fields and the associated sediment accretion between dikes reduce aquatic surface area. However, dikes associated with outside bends often scour sediments and increase pool habitat. Revetment construction has reduced naturally steep banks (Baker et al. 1991). However, channel habitat and transitional areas between the thalweg and shoreline (i.e., channel borders) have persisted over time and continue to provide habitat diversity in the main stem LMR.

Pallid sturgeons occupy the deep water of large, turbid rivers, particularly the main channel (Kallemeyn 1983). They mostly occupy the sandy main channel, but are also found over gravel substrates (USFWS 1993; Bramblett & White 2001; Hurley et al. 2004; Garvey et al. 2009; Koch et al. 2012). Much of the natural habitat throughout the range of pallid sturgeon has been altered and this is thought to have had a negative impact on this species (USFWS 1993). Habitats were once very diverse, and provided a variety of substrates and flow conditions (Baker et al. 1991; USFWS 1993). Extensive modification of the Mississippi River over the last 100 years has changed the form and function of the river (Baker et al. 1991; Prato 2003). Today, habitats are reduced and fragmented; and much of the Mississippi River basin has been channelized to aid in navigation and flood risk management (Baker et al. 1991). The impact of habitat alteration on pallid sturgeon throughout its range is unknown, but recent studies have shown suitable habitat is available (USFWS 2007).

There is a need to restore some of the diversity in the main channel of the river in areas where it is compatible with navigation. The Restoring America’s Greatest River initiative and the Conservation Plan for the Interior Least Tern, Pallid Sturgeon, and Fat Pocketbook Mussel in the Lower Mississippi River both include opportunities for restoring some of this habitat.
Outfitters and Guides

The recreation assessment identified a need for more outfitters and guides. Outfitter and guide companies can benefit from more boat ramps, well managed habitats, information services, marketing and interpretation. Although there are world-famous tourist destinations in the region, the river itself has not been marketed as a destination. New initiatives to draw people to the region will create opportunities for outfitters and guides. Many visitors to the region may be interested in spending a day bird watching, bicycling, fishing or canoeing in the area, and will need equipment, transportation, guides and other services. Outfitters and guides can help people with varying abilities enjoy the river safely.

Boat Ramps

The recreation assessment identified the need for more and better boat ramps on the river. Boat ramps are related to side channel, main channel, outfitter and guide, and safety issues.

There are 129 boat ramps on the LMR. Many of the ramps are located in fast water areas near the commercial navigation channel and are not safe for smaller craft including canoes. More boat ramps located near side channels and back channels would encourage more and safer river use for paddling, fishing and general boating. Canoes and kayaks can be launched anywhere with a parking area, access to the water’s edge and a gentle slope into the water. Motorboats require a hardened boat ramp and a larger parking area to accommodate trailers.

The Louisiana Department of Wildlife and Fish found that there are not many safe and suitable public launches into the Mississippi River south of Baton Rouge. The few that do exist do not offer safe harbor/docking facilities for boats at various river stages. River stages change substantially with season and engineering “safe harbors” for boats at various river stages is difficult. LDWF has received several requests from the public for suitable launches and docking facilities for boats into the Mississippi River at various locations in Southeast Louisiana.

There are 24 million paddlers in North America and the popularity of kayaking is growing. Paddling generates over 300,000 American jobs (Yellow Wood 2013). Paddling canoes and kayaks is becoming more popular in the area. Non-local paddlers spend an average of $503 per excursion and anglers spend $1,261 every year (Yellow Wood 2013). Anglers spend over $40 billion every year (USDI 2011) and generate nearly 600,000 American jobs (Yellow Wood 2013). Fishing accounts for 67% of the outdoor recreational activity in the region (USDI 2011), and many local communities depend on the money it generates for public and private income.

More ramps on the Mississippi River and large tributaries will increase access and safety and provide more opportunities for recreational paddlers and fisherman as well as outfitters and guides. The Restoring America’s Greatest River initiative proposes some boat ramps.
Riverside Parks

The recreation assessment identified the need for more riverside parks in local communities and noted they would be good places for interpretation.

There is a need to improve undeveloped riverfront areas in many towns along the Mississippi River. A few simple improvements could increase the usability of these areas; namely designated parking, shelters, picnic tables, and routine mowing and trash pickup. Local residents would appreciate these small gathering spots and they would provide excellent venues to teach people about the river. Informational signs could offer historical information as well as information about navigation and flood risk management on the river.

Riverboat Landings

The recreation assessment identified a need for better riverboat facilities. The popularity of riverboat cruises is related to marketing and interpretation.

Port to port river cruises are again becoming popular on the Mississippi and worldwide. Over the past five years, international river cruises have enjoyed a 10% passenger increase. In 2011, the American Queen rejoined the Queen of the Mississippi to provide river cruises. Efforts are underway to return the Delta Queen to service and Viking River Cruises, well-known for European river cruises, has announced plans to come to the Mississippi River (Sullivan 2013).

The river cruises offer views of the wilderness, bluffs, historic cities and towns, and the river itself that are not seen from anywhere else. The riverboats dock at many towns along the river. These stops offer excursions for historic tours, nature tours, music shows, or culinary events depending on the area. Many small towns have inadequate facilities for the riverboats to dock and allow passengers of varying physical abilities to disembark. Riverboats stop at Columbus, KY to tour the Civil War Battlefield at Columbus-Belmont State Park, but there is no developed dock or tie off for the boat. Helena, AR lost revenue during the high water in 2011 and the extreme low water in 2012 because the river boats could not dock there. Chamber of Commerce representatives up and down the river envision future facilities that would ensure more consistent access for passenger vessels. These landings can incorporate restaurants and interpretive facilities and become community assets beyond being riverboat docks. For example, Beale Street Landing in Memphis links the world famous blues district with the Mississippi River.

Lodging and Dining

The recreation assessment identified a need for more lodging and dining in the region. This need is related to the need for better marketing of river attractions.

Lodging and dining are readily available along the interstate highway corridors, but are generally lacking along the more rural routes including the Great River Road National Scenic Byway. Agricultural land dominates the area, and there are few commercial developments to provide lodging, camping, food, or other services. There is a need for a variety of lodging types including RV parks, family motels, and bed and breakfast inns. Long distance bicyclists, people...
experiencing the various Native American sites, touring Civil War sites and others would all benefit from more lodging options (Yellow Wood 2013).

**Bicycle Trails**

The recreation assessment identified a need for more bicycling trails. There are bicycle rental shops in downtown Memphis and New Orleans that provide equipment for riding around downtown areas. The expansion of levee trails in Louisiana, the Big River Parkway from New Orleans to St. Louis, and the completion of the Harahan Bridge project at Memphis will spur more opportunities for bicycling in the region. Tourists who come to the region for festivals, bird watching, and family vacations may be interested in renting bicycles for day trips across the river or along the levees. Use of the Mississippi River Trail for multi-day rides would likely expand if lodging and dining facilities were available closer to the trail.

There are 60 million American bicyclists. Bicycling is popular across all demographic groups – ethnicity, age, gender, education, and economic status. Recreational bicycling generates 1.1 million American jobs (Yellow Wood 2013). Americans spend more money every year on bicycling gear and trips ($81 billion) than they do on airplane tickets and fees ($51 billion) (OIA 2012). Bicycle trails and lanes in the major metropolitan areas are expanding. As bicycling is becoming more popular, the demand for linking existing trails and creating longer routes is growing.

**Interpretation**

The recreation assessment identified a need for more interpretation of the river and its resources. The need to provide the public with more information about water quality and the other natural resources of the river was noted previously. This need is related to water quality, data management, faunal community, boat ramp, park, riverboat, bicycling, and marketing issues. Interpretative signs can be a feature of any recreation facility.

Although the Mississippi River watershed drains all or parts of 31 states and 2 Canadian provinces and is the third largest watershed in the world, there is very little information provided to tourists or potential visitors. There are no signs to tell the public that the river creates $105 billion worth of U.S. Gross Domestic Product; provides drinking water for more than 18 million people; transports 62 percent of our nation’s agricultural output; delivers nearly 400 million tons of coal and petroleum products annually; and directly supports one million jobs and indirectly supports millions more.

The Mississippi River and Tributaries Project levees, floodwalls, backwaters and floodways form the world’s largest and most comprehensive flood risk management system. The 2011 Flood drew national and international media attention and travelers in the area stopped to take a look at the river where they could. There is a need for signs and brochures for the public that explain and describe levees, floodwalls and features of the system that protects 1.5 million homes and other structures, and, in 2011 alone, prevented $234 billion in damages.
**Marketing**

The recreation assessment identified a need for a comprehensive marketing program for the LMR. The need for marketing is related to water quality, data management, faunal community, outfitter and guide, boat ramp, riverboat, lodging and dining, bicycling and interpretation issues.

The Mississippi River Parkway Commission manages the Great River Road. Its website (experiencemississippiriver.com) offers a lot of information to help travelers plan trips, but there is a lot of information missing. There is also a need for more cross marketing to reach people who come to the area for a particular event, but might be interested in other activities if information is readily available. The National Geographic Society Geotourism Destination project may provide the needed marketing for the Mississippi River corridor.

GPS navigation units are becoming standard for most travelers. People depend on them to find hotels, restaurants, and other attractions. Scenic byways are not part of the standard package in most units, but some do have the option of downloading more features. The Great River Road is not a single highway route and can be difficult to follow if the roads signs are missing or not visible. GPS units are not programmed to follow the route. There are two commercial companies that collect and update the information available on navigation units. Marketing the LMR should include a dedicated effort to get its motor routes and attractions listed.

**Safety**

The information and recreation assessments both identified a concern about safety on the Mississippi River. Safety concerns are related to recreational uses of the river and should be considered in the development of new facilities.

Safety can never be taken for granted especially around water and on roadways. There is a constant need for programs to teach water safety, safe boating, life jacket use, helmet use, and rules of the road for bicyclists and drivers. Although water quality in the river is generally good and contact is unlikely to cause harm, people should be reminded that drinking the water from any stream or river is not safe. The message of the safety programs needs to compliment marketing information to let people know there are many recreational activities which can be safe if the proper precautions are taken.

The U.S. Coast Guard keeps records of accidents and provides safety training and information for boaters to avoid accidents. There were four collisions on the LMR in 2011 involving recreational vessels, three in Illinois and one in Missouri. All of these accidents involved motorized watercraft. There were no collisions on the river between recreational and commercial vessels. The location of boat ramps is a concern; many ramps are located in swift water areas very close to the commercial navigation channel. These ramps are less safe and usable for smaller crafts including canoes, kayaks, jon boats, and others with small engines. Most of the recreational users want to access the quieter side channel and back water habitats, but have to cross the navigation channel to reach those areas.
On-road bicycling with traffic can be dangerous. Quieter, less used roads in rural areas are preferred over main roads, but there is often a lack of services for emergencies and poor cell phone coverage. Bicyclists are safest on dedicated trails that have moderate bicycling traffic and services at frequent intervals. Programs to encourage helmet use and teach road sharing for both bicyclists and motorists are needed.
IV. RECOMMENDATIONS

The Mississippi River Commission’s 200-year working vision for the Mississippi River seeks to leverage local citizens’ input, international dialogue, science, engineering, technology and public policy to meet the Nation’s needs for our largest river.

Lead secure lives along the river or tributary.

Enjoy fresh air and the surrounding fauna, flora, and forests while hunting, fishing, and recreating.

Travel easily, safely, and affordably.

Drink from and use the abundant waters of any river, stream, or aquifer.

Choose from an abundance of affordable basic goods and essential supplies that are grown, manufactured, and transported along the river to local and world markets.

Throughout public scoping and the development of the three needs assessments, the team, including USACE, USFWS, The Nature Conservancy, National Audubon Society, Mississippi River Corridor –TN, and LMRCC (representing the natural resource agencies in AR, KY, LA, MO, MS, and TN), met with the public, private businesses, National Park Service, Mississippi River Parkway Commission, USDA, and many other entities. This interagency team examined existing plans, programs, missions, and authorities related to the identified needs. The recommendations were formulated to work in concert with the ongoing initiatives to improve and promote the Lower Mississippi River for its ecological and cultural value.

This assessment recommends the creation of three interconnected programs for the Lower Mississippi River that will further the goals of the vision. The success of these three programs will rely on interagency coordination, and public private partnerships. Within these three overall programs, there are recommendations for specific projects and studies. Each of these recommendations includes a description of what is being proposed, what agencies or entities are most appropriate to implement the action, which of the needs in the previous chapter the recommendation addresses, how much it is likely to cost and the value to the nation of addressing the needs. Each recommendation can be implemented as a standalone project, but many of them are interrelated and more benefits would accrue if they are implemented as a comprehensive program.

DATA, INFORMATION, SCIENCE AND COMMUNICATION PROGRAM

The Mississippi River is one of the nation’s greatest assets. There are Federal agencies, state agencies, county and parish governments, cities, towns, non-governmental organizations, and commercial enterprises involved in projects and initiatives on the river. These entities have overlapping information needs. A Data, Information, Science and Communication (DISC) Program for the LMR is necessary to support the next 200 years of Mississippi River management. The following four recommendations define this DISC program.
Science, Technology and Information Center

**Recommendation DISC 1:** Create a Lower Mississippi River Information Center (LMRIC) to collect and store information about the LMR including: historical information, scientific data, management, and use. The LMRIC would locate all available information, perform quality assurance of the data and make it available online and in house. The LMRIC would be open to agencies, universities, researchers, users and the public. The LMRIC would also be a resource for river education outreach projects and science, technology, engineering and math career outreach. USGS has recently reorganized its programs to form the Lower Mississippi-Gulf Water Science Center. This reorganization accomplishes part of this recommendation.

**Lead Organization and Partners:** The USGS would be funded to lead an interagency working group including USACE, EPA, NPS, USFWS, state agencies and others to develop a plan for the LMRIC that addresses location, management, long-term funding, and other specifics. All of the above-mentioned agencies would need to commit to providing existing and future agency data to the LMRIC. The USGS, Kentucky Division of Water, Louisiana Department of Environmental Quality, Mississippi River Network, TNC – Louisiana, TNC – North American Freshwater Program, TNC – Tennessee, MICRA, and LMRCC support this recommendation (see Appendix D).

**Needs Addressed:** This recommendation directly addresses the need for better Data Storage and Availability. It would also be useful in addressing needs for better management of Water Quality, Sediment, Vegetative Mosaic, Invasive Species, Floodplain, Islands, Outfitters and Guides, Interpretation, Marketing and Safety.

**Cost:** The annual operating budget for the Upper Mississippi River Long Term Resource Monitoring Program on the Upper River includes approximately $2,000,000 a year for staff and overhead. The recommended center of the Lower River would have a broader mission, but costs would be similar.

**Value:** The LMRIC would be critical to leverage science, engineering, technology and public policy to meet the Nation’s needs for our largest river. It would promote interagency cooperation, encourage research and foster public interest in the river.

**Sediment Study**

**Recommendation DISC 2:** Continue with sediment analysis of the Middle and Lower Mississippi River that was initiated in 2014 in a Mississippi River Geomorphic and Potamology Study. The analysis will determine sediment sources, sizes, quantities, fates, and transport parameters. It will build on the ongoing work in the Mississippi River Hydrodynamic and Delta Management Study and the work of the Mississippi River/Gulf of Mexico Watershed Nutrient Task Force.

**Lead Organization and Partners:** USACE initiated these studies under the Mississippi River and Tributaries Project and the Louisiana Coastal Area Mississippi River Hydrodynamic and Delta Management studies. USGS is participating in these studies and supports continuing them. The Arkansas Game and Fish Commission, Kentucky Division of Water, and TNC – North American Freshwater, TNC – Tennessee Program support this recommendation (Appendix D).

Costs presented were rough order magnitude estimates used for screening purposes only and are not for authorization or budgetary purposes.
Needs Addressed: This recommendation directly addresses the need for Sediment Management. It would also be useful in addressing Water Quality and Sandbars and Gravel bars.

Cost: The current studies have an annual cost of approximately $4,000,000. Ongoing studies would be expected to have similar costs.

Value: Understanding sediment dynamics is important for river management. Sediment management plans are in place for many of the world’s great rivers: the Rhine (Europe), the Blue Nile (Africa), the Yangtze (Asia), the Columbia (North America), and the Darling (Australia). These plans are benefitting coastal areas, navigation, hydropower, and land conservation around the world. USACE spends up to $170 million annually dredging sediment in the Lower Mississippi River to maintain the navigation channel. Plans for the restoration of coastal wetlands in Louisiana call for more than $25 billion to be spent on a variety of projects, most involving water and sediment management.

Water Quality Monitoring Program

Recommendation DISC 3: Create a dedicated water quality monitoring program for the entire LMR. The new program would standardize collection techniques, timing, methodology and parameters. The data would be useful for developing localized, point-in-time water quality assessments and long term trend monitoring. Existing water quality information would be archived in the LMRIC. The LMRIC would be a valuable asset to support this program and assessments of historic water quality changes.

Lead Organization and Partners: This water quality monitoring program would exceed the capacity of any one agency to develop and manage. The USGS and EPA would lead the effort to create a comprehensive water quality monitoring program. USACE, USFWS, NOAA, the twelve states and the National Tribal Water Council that are part of the Mississippi River/Gulf of Mexico Watershed Nutrient Task Force would also be part. USGS would like to partner with EPA to implement this alternative. The Arkansas Game and Fish Commission, Kentucky Division of Water, Louisiana Department of Environmental Quality, Mississippi Department of Environmental Quality, LMRCC, TNC – Tennessee and TNC – North American Freshwater Program support this recommendation (see Appendix D).

Needs Addressed: This recommendation directly addresses the need for better Water Quality monitoring. The information generated would be important to recommendations for Data Storage and Availability, Sediment, Tributary Management, Vegetative Mosaic, Invasive Species, Floodplain, Interpretation, and Safety.

Cost: The Long Term River Monitoring Program for the Upper Mississippi spends approximately $2,000,000 annually for water quality monitoring including fish sampling and aquatic vegetation surveys. The LMR program would have similar costs.

Value: A water quality monitoring program would insure the Mississippi River provides good water for drinking, recreating, and industry. Water quality is important for the river itself,
coastal wetlands, fish, wildlife, water supply, groundwater, Gulf of Mexico hypoxia, recreation, and tourism. Clean water is vital to the economy of the nation and the quality of life in the lower Mississippi River Valley. The Gulf of Mexico hypoxic zone sits atop one of the most productive fisheries in the world, and the ecological and economic impacts of hypoxia are under study.

**Tributary Watershed Studies (DISC 4)**

**Recommendation DISC 4a:** Conduct Comprehensive Watershed Studies of the major tributary rivers of the LMR as authorized in Section 729 of the Water Resources Development Act of 1986. The following watersheds have been identified as priority watersheds:

- Bayou de Chien – Mayfield Creek, KY
- Obion River, TN
- Forked Deer River, TN
- Hatchie, River, TN
- Bayou Pierre, MS
- Big Black, MS

These watersheds were chosen because they have not received large scale water resources planning; they contain unique resources; there are opportunities for public/private partnerships to foster water resource management; there are problems and opportunities in the watershed that a comprehensive study could address; they are important to water quality and sediment management in the river; and they have the potential to provide valuable habitat and recreation connected to the Mississippi River. The USACE districts and potential local sponsors have previously discussed the potential for most of these studies and some have been included in budget requests. There are other LMR watersheds that may also possess these characteristics, and comprehensive studies could be done on them as well. Appendix A contains maps of each watershed listed above.

**Lead Organization and Partners:** USACE would lead these studies under Section 729 of WRDA 1986. Partners would vary by watershed but would likely include USFWS, USDA, state resource agencies, and NGOs. USGS would be available to support these studies. The Arkansas Game and Fish Commission, Kentucky Division of Water, Mississippi Department of Environmental Quality, LMRC, TNC – Tennessee, and TNC – North American Freshwater Program support this recommendation and are interested in the specific watersheds in their areas (see Appendix D).

**Needs Addressed:** This recommendation directly addresses the need for better Tributary Management. Tributary Management may be important in addressing needs for Water Quality, Sediment, and Floodplains and may provide opportunities to meet needs for Boat Ramps and Bicycle Trails.

**Cost:** These studies would vary from approximately $1,000,000 for the smaller watersheds up to $5,000,000 for the largest.

**Value:** The Mississippi River cannot be separated from its tributaries. They are the source of water, contaminants, nutrients, and sediment. They provide important habitat for fish and
wildlife and provide recreation opportunities. Studies on the basins recommended would provide the information necessary to manage these watersheds to provide benefits locally and to the Mississippi River as a whole.

**Recommendation DISC 4b:** Conduct studies on larger tributary systems. These studies would focus on the active floodplain and existing water resources infrastructure and not on the entire watershed. USACE would need specific authorization to conduct these studies.

**Recommendation DISC 4b.1 St. Francis Basin**

*Lead Organization and Partners:* USACE would lead the study with participation from USDA, St. Francis Levee and Drainage District, Arkansas state resource agencies, and others. The Missouri Department of Conservation and the Arkansas Game and Fish Commission support this recommendation (see Appendix D).

*Cost:* $3,000,000

**Recommendation DISC 4b.2 Arkansas River**

*Lead Organization and Partners:* USACE would lead the study with participation from state and federal agencies in Arkansas, Oklahoma, Kansas, and Colorado. The Arkansas Game and Fish Commission supports this recommendation (see Appendix D).

*Cost:* $5,000,000 to $7,000,000

**Recommendation DISC 4b.3 Ouachita River**

*Lead Organization and Partners:* USACE would lead the study with the Ouachita River Valley Association. The Arkansas Game and Fish Commission, Louisiana Department of Environmental Quality, and TNC-Louisiana support this recommendation (see Appendix D).

*Cost:* $3,000,000

These three rivers were chosen because they contain water resources infrastructure critical to the Mississippi River. Each one is unique in its needs and contributions to the Mississippi River. USGS would be available to support other agencies in assessing existing water resources infrastructure critical to the needs of the Mississippi River. USACE is in ongoing discussions with the existing sponsors of water resources projects on these tributaries and the potential for further studies has been previously discussed. Appendix A contains more information for each river.

**Ecological Inventory (DISC 5)**

**Recommendation DISC 5a:** Island Inventory - Conduct an ecological survey of the islands on the Mississippi River to determine their uniqueness, ecological resources, and opportunities for restoration.

Costs presented were rough order magnitude estimates used for screening purposes only and are not for authorization or budgetary purposes.
**Lead Organization and Partners:** With the approval of the landowners, the USGS and the USACE Engineer Research and Development Center would conduct the survey in cooperation with the USFWS. USGS, Arkansas Game and Fish Commission, Kentucky Division of Water, Missouri Department of Conservation, and TNC – Tennessee support this recommendation (see Appendix D).

**Needs Addressed:** This recommendation directly addresses the need for better information about Mississippi River Islands.

**Cost:** $500,000

**Value:** The ecological inventory of islands in the LMR would determine their value for habitat and potential for restoration.

**Recommendation DISC 5b:** Potential Natural Vegetation Study – Conduct research on the current hydrology, soils, and historic vegetation within the batture and develop a potential vegetation map to inform vegetative restoration.

**Lead Organization and Partners:** The USFWS could lead this effort as part of the National Wetlands Inventory or the Engineer Research and Design Center (ERDC) could lead the study in support of existing projects. USGS, Arkansas Game and Fish Commission, Kentucky Division of Water, Missouri Department of Conservation, Mississippi River Trust, and TNC – Tennessee support this recommendation (see Appendix D).

**Needs Addressed:** This recommendation directly addresses needs for restoring the Vegetative Mosaic and improving the quality of Floodplain habitat.

**Cost:** $1,200,000

**Value:** This information would be provided to landowners, non-governmental organizations, and agencies interested in restoring the vegetative mosaic of the valley.

**HABITAT RESTORATION and MANAGEMENT PROGRAM**

The Mississippi River Valley covers around 25 million acres (Saucier 1994). Historically, bottomland hardwood forests, swamps, marshes, and oxbow wetlands covered most of the valley. The LMR had a sinuous course with numerous meander loops, bends, and oxbow lakes (Baker et al. 1991) and shifted its channel frequently reworking parts of its alluvial meander belt (Saucier 1994, Amoros & Bornette 2002). These diverse habitats supported a rich biotic community including reptiles, amphibians, fish, freshwater mussels, birds, mammals, and plants.

Over the past 150-200 years, the alluvial valley, floodplain, and channel of the LMR have been altered (Baker et al. 1991). Forests have been cleared and drained for agricultural, municipal, residential, and industrial purposes. Levees reduce flooding in most of the valley and the channel has been realigned and constrained.
At least 90 species of freshwater fish (Baker et al. 1991) and around 50 species of mussels (Jones et al. 2005 & USACE records) are found in the LMR. Over 300 species of birds use the Mississippi River valley (Scott ed. 1983). The Mississippi Flyway is an important corridor for migratory waterfowl, shorebirds, and Neotropical migratory birds that require feeding and resting habitat during spring and fall migrations. Nearly 40% of North America’s waterfowl and 60% of all bird species in the US migrate through the valley (Scott ed. 1983).

There are a variety of federally listed threatened and endangered species which are known or believed to occur in the LMR or its tributaries. They include mussels (Alabama heelsplitter, fat pocketbook, Louisiana pearlshell, scaleshell, rabbitsfoot), plants (decurrent false aster, Geocarpon minimum, pondberry), birds (interior least tern, red-cockaded woodpecker), mammals (Indiana bat, Louisiana black bear), and fish (pallid sturgeon, relict darter). The USFWS developed Recovery Plans detailing the life history, habitat needs, threats, and status for all of these species.

The LMRCC is a coalition of 12 state natural resources conservation and environmental quality agencies from Arkansas, Kentucky, Louisiana, Mississippi, Missouri and Tennessee. It provides the only regional forum dedicated to conserving the natural resources of the Lower Mississippi River floodplain. LMRCC focuses on habitat restoration, landscape level conservation planning, and natural resource-based economic development. USFWS leads the effort and provides a full time coordinator. USGS, USACE, EPA, and NRCS are cooperating agencies. The LMRCC coalition would be crucial to the success of any habitat program on the Lower River.

**Conservation Reach Studies**

**Recommendation HRMP 1.** Conduct eight conservation reach habitat restoration studies on the LMR. The Mississippi River ecosystem is a dynamic system with interactions among the terrestrial and aquatic systems, main channel and side channel areas, mudflats, backwaters, tributaries, and islands. These feasibility studies would examine the Mississippi River and batture to determine if there is Federal interest sufficient to justify construction of ecosystem restoration features. Eight reaches have been identified as priorities.

- Wolf Island to Island 8 Reach RM 946 – 910 (36 mi.)
- Hatchie/Loosahatchie Reach RM 775 – 736 (39 mi)
- Islands 62/63 Reach RM 650 - 618 (32 mi.)
- Arkansas River Reach RM 599 – 556 (43 mi.)
- Possum (Worthington-Pittman) Reach RM 524 – 490 (34 mi.)
- Palmyra River Reach RM 431 – 398 (33 mi.)
- Lake Mary Reach RM 360 -322 (38 mi.)
- Raccourci Cutoff Reach RM 300 -265 (35 mi.)

These reaches were chosen because they may provide valuable habitat for rare species; they each contain a channel crossing; the batture is wide in the reach; and there is a concentration of previously identified potential projects. ERDC identified the Islands 62/63 Reach in 2013 as a priority in 2013 and has already begun in depth geomorphic, sediment, hydraulic and biological surveys in the reach. Several of the reaches coincide with those the USACE Interior Least Tern **Conservation Reach Studies**

**Recommendation HRMP 1.** Conduct eight conservation reach habitat restoration studies on the LMR. The Mississippi River ecosystem is a dynamic system with interactions among the terrestrial and aquatic systems, main channel and side channel areas, mudflats, backwaters, tributaries, and islands. These feasibility studies would examine the Mississippi River and batture to determine if there is Federal interest sufficient to justify construction of ecosystem restoration features. Eight reaches have been identified as priorities.

- Wolf Island to Island 8 Reach RM 946 – 910 (36 mi.)
- Hatchie/Loosahatchie Reach RM 775 – 736 (39 mi)
- Islands 62/63 Reach RM 650 - 618 (32 mi.)
- Arkansas River Reach RM 599 – 556 (43 mi.)
- Possum (Worthington-Pittman) Reach RM 524 – 490 (34 mi.)
- Palmyra River Reach RM 431 – 398 (33 mi.)
- Lake Mary Reach RM 360 -322 (38 mi.)
- Raccourci Cutoff Reach RM 300 -265 (35 mi.)

These reaches were chosen because they may provide valuable habitat for rare species; they each contain a channel crossing; the batture is wide in the reach; and there is a concentration of previously identified potential projects. ERDC identified the Islands 62/63 Reach in 2013 as a priority in 2013 and has already begun in depth geomorphic, sediment, hydraulic and biological surveys in the reach. Several of the reaches coincide with those the USACE Interior Least Tern **Conservation Reach Studies**

**Recommendation HRMP 1.** Conduct eight conservation reach habitat restoration studies on the LMR. The Mississippi River ecosystem is a dynamic system with interactions among the terrestrial and aquatic systems, main channel and side channel areas, mudflats, backwaters, tributaries, and islands. - Lake Mary Reach RM 360 -322 (38 mi.)
- Raccourci Cutoff Reach RM 300 -265 (35 mi.)

These reaches were chosen because they may provide valuable habitat for rare species; they each contain a channel crossing; the batture is wide in the reach; and there is a concentration of previously identified potential projects. ERDC identified the Islands 62/63 Reach in 2013 as a priority in 2013 and has already begun in depth geomorphic, sediment, hydraulic and biological surveys in the reach. Several of the reaches coincide with those the USACE Interior Least Tern
Working Group identified as priorities. ERDC and USFWS personnel participated in the selection of the reaches. Appendix B contains maps and more detailed descriptions of each reach.

Lead Organization and Partners: USACE would need specific authorization for this priority reach habitat program. Each reach study would be conducted separately and would require non-Federal sponsors and cooperation with other Federal agencies like the USFWS and USDA. The studies would also consider restoration of upland habitats within the batture that are outside of the USACE ecosystem restoration mission. LMRCC’s Restoring America’s Greatest River (RAGR) initiative has already identified 104 potential projects that fall within these reaches. The Arkansas Game and Fish Commission, Kentucky Division of Water, Louisiana Department of Environmental Quality, Mississippi Department of Environmental Quality, Missouri Department of Conservation, MICRA, LMRCC, Missouri Department of Conservation, Mississippi River Trust, TNC – Tennessee, and TNC – North American Freshwater Program support this recommendation (see Appendix D).

Needs Addressed: This recommendation directly addresses needs for restoration of Side Channels, Backwaters and Oxbows, Sandbars and Gravel Bars, Main Channel Habitat, Vegetative Mosaic, Floodplain and Island habitats. It may also be useful in addressing needs for Water Quality, Sediment, Data Storage and Availability, Invasive Species, Boat Ramps and Safety.

Cost: $3,000,000 per study

Value: Each reach has opportunities to enhance a broad spectrum of features, i.e. restorable side channels, backwaters, and oxbows, a wide floodplain, large islands, populations of threatened and endangered species, and sandbars. These eight reaches total 290 miles or nearly 30% of the LMR. These studies would consider recreation features along with ecosystem restoration.

Aquatic Habitat Restoration Studies

Recommendation HRMP 2. Conduct aquatic habitat restoration studies in areas outside the eight reaches mentioned above. Appendix C lists 125 projects that could be studied under one of two existing programs.

Recommendation HRMP 2a. Conduct Aquatic Habitat Ecosystem Restoration studies using the existing USACE authority under Section 1135 of the Water Resources Development Act (WRDA) of 1986 or Section 206 of WRDA 1996. This program has already been used to restore habitat on the LMR, e.g. Tunica Lake.

Lead Organization and Partners: USACE has the authority to conduct these studies at the request of a non-federal sponsor, i.e. a state or local agency or non-governmental organization. Arkansas Game and Fish Commission, Kentucky Division of Water, Louisiana Department of Environmental Quality, TNC – Tennessee, and MICRA support this recommendation (Appendix D).

Costs presented were rough order magnitude estimates used for screening purposes only and are not for authorization or budgetary purposes.
Needs Addressed: This recommendation directly addresses needs for restoration of Side Channels, Backwaters and Oxbows, Sandbars and Gravel Bars, Main Channel Habitat, and Island habitats. It may also be useful in addressing needs for Boat Ramps and Safety.

Cost: The Water Resources Reform and Development Act (WRRDA 2014) set a total per project federal cost limit of $10,000,000 for these two authorities; approximate total cost with cost share match is $15,000,000. Many of the listed projects can be completed for less than the limit, e.g. Tunica Weir Section 1135 was completed in 2005 for less than $1,500,000.

Value: These projects have the potential to restore important habitat.

Recommendation HRMP 2b. Use the existing USFWS National Fish Passage Program to restore side channels and other aquatic habitat on the Mississippi. This program has already been used to restore 56 miles of habitat on the LMR.

Lead Organization and Partners: LMRCC and the USFWS are the lead agencies. Fish Passage projects require a cost-sharing partner which can include private individuals; Federal, tribal, state, and local governments and agencies; and non-governmental organizations. Kentucky Division of Water, Missouri Department of Conservation, Louisiana Department of Environmental Quality, MICRA, Mississippi River Trust, and TNC – Tennessee support this recommendation and LMRCC stated its intent to continue with the program (Appendix D).

Needs Addressed: This recommendation directly addresses needs for restoration of Side Channels, Backwaters and Oxbows, Sandbars and Gravel Bars, Main Channel Habitat, and Island habitats. It may also be useful in addressing needs for Boat Ramps and Safety.

Cost: Projects implemented through the Fish Passage Program average approximately $200,000 each.

Value: These projects have the potential to restore important habitat.

Terrestrial Habitat Program

Recommendation HRMP 3: Terrestrial Habitat Program – Continue to implement programs that restore native vegetation to the batture. Most of the land within the batture is in private ownership. There are programs to assist landowners interested in reforestation.

Lead Organization and Partners: The NRCS provides technical and financial assistance to landowners for water quality and wetlands improvement projects. NRCS has established the Mississippi River Basin Healthy Watersheds Initiative to improve the health of the Mississippi River Basin. Through this Initiative, NRCS and its partners help producers in selected watersheds in the Mississippi River Basin voluntarily implement conservation practices that avoid, control, and trap nutrient runoff; improve wildlife habitat; and maintain agricultural productivity. Arkansas Game and Fish Commission, Kentucky Division of Water, Louisiana Department of Environmental Quality, Missouri Department of Conservation, Mississippi River Trust, and TNC – Tennessee support this recommendation (Appendix D).
The Lower Mississippi Valley Joint Venture (LMVJV) is a self-directed, non-regulatory private, state, and Federal conservation partnership. LMVJV’s goal is sustaining bird populations and their habitats within the Lower Mississippi Valley and West Gulf Coastal Plain regions. They implement and communicate the goals and objectives of relevant national and international bird conservation plans (LMVJV 2002). The Lower Mississippi Valley Joint Venture Plan was formulated to address problems that traditionally confronted wetland conservation in the region; namely, clearing of forests for agriculture and extensive alterations of wetland hydrology resulting from basin-wide flood control and drainage. In an effort to further refine its conservation delivery infrastructure, the LMVJV partnership has chartered the development of geographically-explicit Conservation Delivery Networks as the forum for coordinating its on-the-ground actions. There are four networks overlying the Lower River.

**Needs Addressed:** This recommendation directly addresses needs for restoration of the native Vegetative Mosaic and quality Floodplain habitat. It would also be important for managing Water Quality.

**Cost:** The Wetlands Reserve Enhancement Program, part of the NRCS Wetlands Reserve Program, provides the funding. Between 2010 and 2013, the NRCS has formalized agreements with 47 landowners in the basin, investing $17.8 million in long-term conservation easements and wetland restoration projects.

**Value:** The initiative targets restoration of over 11,000 acres of wetland habitat and may prevent sediment and nutrients from entering waterways, decrease flooding, and improve bird and fish habitat. Approximately two thirds of the work is within the batture.

**Invasive Species Program**

**Recommendation HRMP 4:** Invasive Species - There are several plans in place to address invasive species on the river. Many of the species do not directly affect habitat, but they do impact native populations. Privet would be addressed site-specifically when developing forest restoration plans. USDA is doing research on kudzu control in the south. This research and control programs would continue. The Aquatic Nuisance Species Task Force (ANSTF) and Mississippi Interstate Cooperative Resource Association (MICRA) have both developed plans to manage and control carp and other aquatic nuisance species. These plans should be implemented.

**Lead Organization and Partners:** Both MICRA and ANSTF are interagency organizations. Implementing the aquatic nuisance species plans would require cooperation between the states and USFWS. Other agencies would play a role in limiting the spread of species. Arkansas Game and Fish Commission, Kentucky Division of Water, Louisiana Department of Environmental Quality, Missouri Department of Conservation, LMRCC, MICRA, and TNC – Tennessee support this recommendation (Appendix D).
Needs Addressed:  This recommendation directly addresses needs to manage Invasive Species. It would be important for restoring habitat quality in the Floodplain and reestablishing a native vegetative mosaic.

Cost: MICRA’s *An Action Plan to Minimize Ecological Impacts of Aquatic Invasive Species in the Mississippi River Basin* estimates federal funding needs at $104,450,000 annually. This is a comprehensive plan for the entire Mississippi River Basin. The plan increment for the Lower Mississippi River is a small piece of the total.

Value: Invasive species have entered, and continue to enter and spread within the United States from a variety of sources. The strategy would minimize risk of new introductions and focus effort on containing and controlling established populations. Reducing the impact of invasive species may benefit native aquatic resources within the Basin.

RECREATION PROGRAM

Recreation and tourism are important economic sectors in the LMR. Outdoor recreation in the region generates over $1.3 billion in direct revenues and employs nearly 55,000 people. Tourism in the area generates $15.5 billion in direct revenues and employs over 190,000 people.

The Mississippi River Parkway Commission (MRPC) works collaboratively with other entities to promote travel to the Mississippi River, Great River Road National Scenic Byway and the surrounding ten states: Minnesota, Wisconsin, Iowa, Illinois, Missouri, Kentucky, Tennessee, Arkansas, Mississippi and Louisiana. It was established in 1938 to preserve, promote, and enhance the scenic, historic, and recreational assets of the Great River Road National Scenic Byway and foster economic growth in the corridor.

Within the U.S. Department of Transportation, the Federal Highway Administration (FHWA) has responsibility for the National Scenic Byways Program. The Program is a grassroots, collaborative effort established to help recognize, preserve and enhance selected roads throughout the United States. The Secretary of Transportation recognizes certain roads as America's Byways® - All-American Roads or National Scenic Byways - based on one or more archaeological, cultural, historic, natural, recreational and scenic intrinsic qualities. The law guiding implementation of the National Scenic Byways Program is in Section 162, Title 23 of the United States Code; 23 U.S.C. 162.

The Secretary of Transportation makes grants to States and Indian tribes to implement projects on highways designated as National Scenic Byways or All-American Roads, or as State or Indian tribe scenic byways. Projects submitted for consideration should benefit the byway traveler's experience, whether it will help manage the intrinsic qualities that support the byway's designation, shape the byway's story, interpret the story for visitors, or improve visitor facilities along the byway.

The National Park Service’s Rivers Trails and Conservation Assistance (RTCA) program extends and expands the benefits of the National Park Service throughout the nation. They help connect all Americans to their parks, trails, rivers, and other special places. When a community asks for assistance with a project, RTCA staff provides free, on-location facilitation and planning.
expertise. RTCA helps guide a project from conception to completion. RTCA draws from project experiences across the country and adapts best practices to a community's specific needs. The Mississippi River Connections Collaborative (MRCC) is a part of the RTCA.

The mission of the MRCC is to promote the magnificence and diversity of the Mississippi River as a national treasured landscape. This joint effort works to increase recognition of America’s Great River, enhance the existing resources, acquire funding for conservation, and ensure that all Americans can enjoy these assets in the future. The MRCC coalition would be crucial to expanding recreation and tourism on the LMR.

**Boat Ramps**

**Recommendation RP 1.** Boat Ramps – Increase the number of boat ramps on the LMR. A boat ramp every 10 to 20 miles on the river would provide more opportunities for paddlers, fishermen and hunters and would increase the ability to conduct search and rescue operations. More ramps would be available to directly access backwaters and side channels. Ramps also provide locations for interpretive signs about the Mississippi River, environmental education and safety.

**Lead Organization and Partners:** LMRCC identified 23 potential boat ramps in RAGR. Local governments and private landowners could get permits from USACE and develop free or for profit ramps. RCTA and National Scenic Byway Grants may be available to help local communities plan and build boat ramps. Boat ramps may be added to other USACE projects under certain conditions, but this option may not provide enough ramps to meet the needs of recreational users. Arkansas Game and Fish Commission, Louisiana Department of Environmental Quality, Missouri Department of Conservation, LMRCC, and TNC – Tennessee support this recommendation (Appendix D).

**Needs Addressed:** This recommendation directly addresses needs for more Boat Ramps and may help address needs for improved Safety.

**Cost:** Variable depending on size and location; $50,000 - $750,000 each.

**Value:** Boat ramps would provide recreational opportunities for paddlers, anglers, duck hunters and bird watchers. These users spend millions of dollars annually in the region and support manufacturing jobs nationwide. Existing ramps launch boaters into the main navigation channel. Ramps designed and located for recreational use would be safer and encourage people to recreate in the calmer side channel and backwater areas.

**Bicycle Trails**

**Recommendation RP 2.** Bicycle trails – Increase the total mileage of bicycle trails and especially trails where vehicles are not allowed (except as necessary for farming, etc.) The existing Mississippi River Trail extends the full length of the river, but lies mostly on public roads. The Big River Parkway is a planned trail extending from New Orleans, LA to St. Louis, MO on the levees. The Harahan Bridge over the Mississippi River will link Memphis, TN to this trail. This initiative will provide a unique opportunity for long distance riders. Shorter trails in

Costs presented were rough order magnitude estimates used for screening purposes only and are not for authorization or budgetary purposes.
and around towns and linking to this longer trail may still be needed. The Old Vicksburg Bridge is used for bicycling and pedestrian events and could become a permanent bicycling asset.

**Lead Organization and Partners:** The Big River Strategic Initiative is leading the development of the Big River Parkway. Any trail on the levee would require approval of the local levee district and a permit from USACE. USACE has some authority to add recreational features to flood risk management and ecosystem restoration projects. These opportunities may be limited, but would be explored with the non-Federal sponsors of the projects. Many local communities are developing bicycling lanes on existing roads and developing new bicycle/pedestrian trails. The Louisiana Department of Environmental Quality and TNC – Tennessee support this recommendation (Appendix D).

**Needs Addressed:** This recommendation directly addresses needs for more Bicycle Trails and would provide opportunities to meet the needs for Interpretation.

**Cost:** Bicycle trails and amenities are highly variable. Urban trails can cost around $1,000,000 per mile including land acquisition, earth moving and paving. Creating the bicycling path on the Harahan Bridge may cost over $30,000,000.

**Value:** Americans spend more money every year on bicycling gear and trips ($81 billion) than they do on airplane tickets and fees ($51 billion) (OIA 2012). Bike trails and lanes in major metropolitan areas are expanding. As biking is becoming more popular, the demand for linking existing trails and creating longer routes is growing. Bike trails on levees and converted railroad lines would likely provide a positive economic return on the investment. The expansion of levee trails in Louisiana, the Big River Parkway from New Orleans to St. Louis, and the completion of the Harahan Bridge project at Memphis may spur more opportunities for bicycling in the region.

**Riverfront Parks**

**Recommendation RP 3.** Riverfront Parks – Develop riverfront parks for the use of local communities.

**Lead Organization and Partners:** NPS can help local communities plan these types of amenities and Parkway grants may be available to help cities pay for them. USACE Planning Assistance to States Program may also be able to help plan for these facilities. Louisiana Department of Environmental Quality and TNC – Tennessee support this recommendation (Appendix D).

**Needs Addressed:** This recommendation directly addresses needs for Riverfront Parks and would provide opportunities to meet the needs for Interpretation.

**Cost:** Varies based on site, size, and amenities.

**Value:** Local residents would appreciate these small gathering spots and they would provide excellent venues to teach people about the river. Informational signs could offer historical information as well as information about navigation and flood risk management on the river.
Riverboat Landings

Recommendation RP 4. Riverboat Landings – Develop more and better riverboat landings along the Lower River to provide reliable and accessible opportunities for riverboat passengers to visit and enjoy cities and towns all along the river. A USACE study examined the feasibility of a facility in West Feliciana Parish, LA. The study found the project would provide a positive benefit cost ratio, but it could not be implemented because the project benefits were entirely recreational. This project would be given high priority for implementation because it has already been found to be cost effective.

Lead Organization and Partners: Local communities would lead these efforts and the NPS RCTA program and the USACE Planning Assistance to States Program may be able to help in planning for these facilities. The Louisiana Department of Environmental Quality, TNC – Tennessee and the St. Francisville Area Foundation support this recommendation (Appendix D).

Needs Addressed: This recommendation directly addresses needs for Riverboat Landings and would provide opportunities to meet the needs for Interpretation.

Cost: Varies based on site, size, and amenities.

Value: Better facilities for riverboats would provide more consistent access and allow passengers of varying physical abilities to disembark. As the number of riverboats increases, there may be more opportunities for small towns to host passengers for day excursions. This would have an economic benefit. These landings can incorporate restaurants and interpretive facilities and become community assets beyond being riverboat docks.

Marketing

Recommendation RP 5. Marketing

Recommendation RP 5a. National Geographic Geotourism Destination – Continue developing the Mississippi River as a Geotourism Destination which may include gathering and publicizing information on lodging, restaurants, amenities, museums, festivals, events, tours, culture, ecology and other features.

Lead Organization and Partners: MRCC and Big River Strategic Initiative are working with National Geographic and gathering a group of other partners to support this initiative. TNC – Tennessee and the Louisiana Department of Environmental Quality support this recommendation (Appendix D).

Needs Addressed: This recommendation directly addresses the need for Marketing and may be valuable in addressing the needs for Lodging and Dining, Outfitters and Guides, Interpretation and Safety.

Cost: $1,000,000

Costs presented were rough order magnitude estimates used for screening purposes only and are not for authorization or budgetary purposes.
Value: The National Geographic Society Geotourism Destination project would provide a one stop source to highlight all of the cultural, historical, natural and musical features of the Mississippi River and link potential travelers with lodging, dining and other services.

Recommendation RP 5b. Great River Road – Pursue a National Parkway grant to develop a GPS feature for National Scenic Byways.

Lead Organization and Partners: The MRPC would work with a coalition of parkway commissions to get scenic byways included on GPS navigation systems. TNC – Tennessee and the Louisiana Department of Environmental Quality support this recommendation (Appendix D).

Needs Addressed: This recommendation directly addresses the need for Marketing and may be valuable in addressing the needs for Lodging and Dining, Outfitters and Guides, Interpretation and Safety.

Cost: $1,000,000

Value: GPS navigation units are becoming standard for most travelers who depend on them to find hotels, restaurants, and other attractions. Scenic Byways are not programmed into GPS systems. The Great River Road does not follow a single highway route, and turn by turn directions are not included in the brochures. The route can be difficult to follow if the road signs are missing or not visible.

Lodging and Dining

Recommendation RP 6. Lodging & Dining - Develop more lodging and dining options on the LMR. Mobile food trucks at popular sites could meet some of the demand for dining on the LMR during peak usage, e.g. along the Big River Parkway on weekends. Most lodging would need to be developed outside of the batture, but there is some demand for camping along the river which could be met on State lands.

Lead Organization and Partners: Commercial interests would develop more lodging and dining options on the LMR. Local governments may have a limited role in permitting these services. TNC – Tennessee and the Louisiana Department of Environmental Quality support this recommendation (Appendix D).

Needs Addressed: This recommendation directly addresses the need for more Lodging and Dining options.

Cost: Varies based on site, size, and amenities.

Value: Lodging and dining would enhance the recreational and tourism value of existing sites and encourage more visits to the area.
Outfitters and Guides

Recommendation RP 7. Outfitter and Guide - Establish more outfitter & guide services on the LMR.

Lead Organization and Partners: These may be mostly commercial enterprises, but non-governmental organizations like the National Audubon Society do sometimes offer guided field trips to view birds and other wildlife. Arkansas Game and Fish Commission, TNC – Tennessee and the Louisiana Department of Environmental Quality support this recommendation (Appendix D).

Needs Addressed: This recommendation directly addresses the need for more Outfitters and Guides and would improve Safety.

Cost: Varies based on services offered and geographic operating area.

Value: Outfitters and guides are needed to get visitors in the region to spend time on or near the Mississippi River. Many travelers may be interested in spending a day biking, fishing or canoeing in the area, but may not want to bring the equipment with them. Travelers and local residents may lack the required skills to safely experience the river on their own.

Recommendation DISC 4

Bayou de Chien - Mayfield  A – 3
Obion  A – 5
Forked Deer  A – 7
Hatchie  A – 9
Bayou Pierre  A – 11
Big Black  A – 13
St. Francis  A – 15
Arkansas River  A – 17
Ouachita River  A – 19
Watershed Name: Bayou de Chien-Mayfield

Watershed Size: 970 sq. mi.

Location: Bayou de Chien and Mayfield Creek arise in Graves County, KY and flow generally westward to the Mississippi River at Hickman, KY. Bayou de Chien flows into the Mississippi River at RM 922 forming Elvis Stahr (Hickman) Harbor. Mayfield Creek enters the river at RM 950.

Special Status Species: Relict darter (*Etheostoma chienense*), Indiana bat (*Myotis soldalis*)

General Description: The terrain along the upper portion of Bayou de Chien is rugged with narrow valleys that rise 50-100 feet along steep slopes to narrow ridges. Downstream of the Purchase Parkway, the valley along the main stem and major tributaries becomes quite wide. However terrain along smaller tributaries remains rugged with steep slopes rising in excess of 100 feet to narrow ridges. In the lower portion of the watershed, the slopes become less severe with elevation gains generally less than 50 feet. The north side of the watershed below Mud Creek is part of the Mississippi River floodplain where land is gently rolling with little elevation variance.

Land Use: The watershed is predominately agricultural. Forested areas are confined to wetlands and on the steeper slopes in the upper portion of the watershed. About 1200 acres of the Obion Creek Wildlife Management Area are located in the lower portion of the watershed. Residential, commercial, and industrial areas are located in and around Hickman. Residential areas are also located near Cayce, Crutchfield, and Water Valley.

Problems & Opportunities: Much of Bayou de Chien and its tributaries upstream of Highway 239 is an Outstanding Resource Water due to the presence of the relict darter. Much of the valley along the main stem is wetland.
Watershed Name: Obion

Watershed Size: (2473 sq. mi.)

Location: The Obion River is located in northwest Tennessee and includes parts of Carroll, Henderson, Dyer, Gibson, Henry, Lake, Lauderdale, Obion, and Weakley counties. It enters the Mississippi River at RM 819.

Special Status Species: Pallid sturgeon (*Scaphirhynchus albus*), alligator snapping turtle (*Macroclemys temminckii*), alligator gar (*Lepisosteus spatula*), Indiana bat (*Myotis soldalis*), northern madtom (*Noturus stigmosus*), and the firebelly darter (*Etheostoma pyrrhogaster*).

General Description: The Obion River system is the primary surface water drainage system of northwest Tennessee and is comprised of four major forks, the North Fork, Middle Fork, South Fork and Rutherford Fork that each flow as separate streams for the majority of their lengths. The confluences of these forks are only a few miles above the mouth of the Obion's discharge into the Mississippi River.

Land Use: Lake Isom and Reelfoot Lake National Wildlife Refuges lie within the watershed as well as smaller wildlife management areas and refuges. The Obion River is separated into three watersheds: North Fork of the Obion, South Fork of the Obion and the Rutherford Fork of the Obion. Gooch Wildlife Management Area also lies in the watershed.

Problems & Opportunities: The Obion River, like many others in west Tennessee, has been heavily modified to alleviate the risk of flooding for residents and agriculture. Row-crop production and pasture land, dominate land use in the watershed. Best Management Practices, improved zoning guidelines, building codes, streamside buffer zones and greenways, and general landowner education could reduce sedimentation. Other management measures may include re-establishing bank vegetation to stabilize banks, and restoring wetlands and meanders to reduce water velocity and scouring.
Watershed Name: Forked Deer

Watershed Size – (2086 sq. mi.)

Location: The Forked Deer River watershed covers several counties in West Tennessee. It originally entered the Mississippi River near RM 803, but the lower end of the river was rerouted into the Obion which enters the river at RM 819.

Special Status Species: Firebelly darter (*Etheostoma pyrrhogaster*), barking treefrog (*Hyla gratiosa*), Indiana bat (*Myotis soldalis*), and the Hatchie burrowing crayfish (*Fallicambarus hortoni*), as well as heron rookeries

General Description: The Forked Deer has three major branches, the North fork, Middle Fork, and South Fork. Most of the system has been channelized. There are numerous small dams for flood detention and sediment storage.

Land Use: Land use in the Forked Deer River Watershed is predominately row crop agriculture and pasture. The Tigrett Wildlife Management Areas is over 7,500 acres and provides habitat for waterfowl, wading birds, bald eagle and Mississippi kite.

Problems & Opportunities: Excess sediment within the watershed has caused valley plugs to form within channelized reaches of the river, and they will likely continue to form as degradation of upstream reaches of the Forked Deer and its tributaries continues and the watershed struggles to reach equilibrium. Valley plugs can force the river into old meanders and cause higher flood elevations or ponding within wooded areas leading to tree mortality. Forested tracts of the Forked Deer River appear to have shifted from dominantly mixed oak, sweetgum, and bald cypress to a more disturbance tolerant mix of red maple, black willow, and river birch. Conditions within the watershed are not likely to substantially improve without major watershed-scale interventions such as meander restoration, restoration of hydrology, and bottomland hardwood restoration as well as sediment load reductions.
Watershed Name: Hatchie

Watershed Size: (2610 sq. mi.)

Location: The Hatchie River is located in west Tennessee and north Mississippi and includes parts of Hardeman, McNairy, Haywood, Madison, Tipton, and Lauderdale Counties in TN and Carroll, Henderson, Dyer, Gibson, Henry, Lake, Lauderdale, Obion, and Weakley counties. It enters the Mississippi River at RM 773.

Special Status Species: Indiana bat (Myotis soldalis), naked sand darter (Ammocrypta beanii), rabbitsfoot mussel (Quadrula cylindrica), bald eagle (Haliaeetus leucocephalus), Swainson’s, prairie and cerulean warblers.

General Description: The Hatchie River is the only undammed and unchannelized tributary to the LMR. Most of the Hatchie’s 36 tributaries have been channelized or altered, and they are carrying heavy sediment loads into the Hatchie. The increased sediment from the tributaries threatens to create valley plugs in the Hatchie. The Hatchie River contains the largest forested floodplain in Tennessee.

Land Use: The area includes the Hatchie National Wildlife Refuge (11,500 + acres), Lower Hatchie River NWR (9,500 acres), the Chickasaw NWR (25,000 ac), Chickasaw State Forest (12,500 ac), Big Hill Pond State Park (5,000 ac) and the Fort Pillow State Historic Park, the site of an infamous Civil War battle. USDA has acquired Wetland Reserve Program Easements throughout the watershed.

Problems & Opportunities: The natural flood processes that drive the ecosystem are intact, sustaining the river and wetland habitats that support a rich ecological diversity. These habitats support more than 100 species of fish and 35 species of mussels. With 11 species of catfish, the Hatchie probably contains more species of catfish than any other river in North America.

USGS is actively studying the Upper Mississippi Embayment (groundwater), and the Hatchie watershed overlies part of the recharge zone. This aquifer supplies 17% of all water withdrawn from aquifers in the U.S. and is one of the most valuable natural resources in the region.
Watershed Name: Bayou Pierre

Watershed Size: (1070 sq. mi)

Location: Bayou Pierre originates northwest of Brookhaven and along with the Homochitto and Buffalo Rivers drains much of Hinds, Lincoln, Franklin, Copiah and Claiborne Counties in MS. It enters the Mississippi River at River Mile 395. The Homochitto and Buffalo Rivers would be included in this study.

Special Status Species: Bayou darter (Etheostoma rubrum)

General Description: Bayou Pierre is experiencing an alarming land loss rate due to bank caving and head-cutting, directly impacting the endangered bayou darter and its habitat. Bayou Pierre is the only remaining habitat of the bayou darter and further degradation could jeopardize the continuing existence of the species. In addition, effluent runoff from poultry industry could lead to stream contamination and fish kills. The watershed investigation could lead to new alternatives to combat these problems and directly benefit the habitat of the bayou darter. Ross et al. (2001) noted extensive erosion throughout the system. The lower reaches of the watershed are recovering, but headcutting is ongoing in the upper reaches. Headcutting is a common problem in LMR tributaries (Shankman 1996). The Mississippi River has degraded in some reaches and caused headcuts to progress up the tributaries. Soils in the region are highly erodible and the rivers are not able to re-stabilize without intervention. Despite these conditions, the bayou darter population remains stable (Ross et al. 2001).

Land Use: Timberlands dominate the watershed, but, livestock grazing and row crop agriculture are also common. The 191,000- acre Homochitto National Forest lies in the watershed.

Problems & Opportunities: The Bayou Pierre Watershed Enhancement Group includes a group of landowners, agencies, and organizations striving to improve the quality of the water, land, and wildlife within the watershed.
Watershed Name: Big Black

Watershed Size: (3384 sq. mi)

Location: The Big Black River originates in Webster County near Eupora, MS and flows about 300 miles towards the southwest overlying Choctaw, Montgomery, Carroll, Holmes, Attala, Yazoo, Madison, Claiborne, Hinds, and Warren Counties, MS. It enters the Mississippi River at River Mile 409.

Special Status Species:

General Description: The estimated population within the Big Black River watershed exceeds 176,000, with residents primarily located around Jackson and surrounding communities. The Big Black River watershed includes 3 of the fastest developing residential and business areas in the state. The basin is also known for producing large whitetail deer.

Land Use: According to the U.S. Geological Survey, land cover in the watershed is approximately 56% forested and 39% agriculture, and the remaining areas are developed. Agricultural runoff results in large amounts of suspended sediments and turbid conditions, primarily in the northern part of the basin. Although most of the basin streams are turbid with low current velocity, other basin streams have swift current, sandy substrate, and relatively clear water. The site of the Civil War Battle of Big Black River Bridge lies in the watershed.

Problems & Opportunities: The Mississippi Department of Environmental Quality is currently investigating non-point source pollution control measures in the Big Black River Basin because water quality is significantly influenced in certain areas of the watershed by diverse land based urban development and stormwater runoff, agricultural activities, and sedimentation.
River Name: St. Francis

River Location: the St. Francis River heads in Missouri, flows over 400 miles south through Arkansas, and enters the Mississippi River at RM 672.

Specific Proposal: Conduct a study of the water resources of the St. Francis River Basin to assess the opportunities for water reallocation among the various channels, ecosystem restoration, agricultural water supply, and recreation projects compatible with the existing flood risk management system. Most of the watershed now drains into the Mississippi River through the Huxtable Pumping Station near Marianna, AR.

Lead Organization and Partners: USACE would lead the study with participation from USDA, St. Francis Levee and Drainage District, Arkansas state resource agencies, and others.

Needs Addressed: This recommendation directly addresses the need for better Tributary Management. This recommendation will be important in addressing needs for Water Quality, Sediment, and Floodplains and may provide opportunities to meet the need for more Bicycle Trails.

Cost: $3,000,000

Value: The St Francis River basin covers over 7500 square miles in Arkansas and Missouri. The watershed contains valuable agricultural land and is one of the premier rice growing regions in the world. The rivers and streams have been altered to facilitate drainage. Despite the stream alterations, the basin still supports a healthy assemblage of mussels and many thriving populations of the federally listed fat pocketbook mussel. The historic meandering channel carries little water now, but still has several large mussel beds. The Arkansas Game and Fish Commission has specific concerns regarding fish entrainment that would be addressed in this study.
River Name: Arkansas River

River Location: The Arkansas River heads at the Continental Divide in Colorado and flows over 1,400 miles southeast through Kansas, Oklahoma, and Arkansas and enters the Mississippi River at RM 580.

Specific Proposal: The Arkansas is the sixth longest river in the United States and the largest tributary of the Lower Mississippi River. It is important for habitat, recreation, navigation, and water supply. The upper end of the watershed includes several Bureau of Reclamation projects, and the middle and lower portions include large reservoirs for flood risk management and hydropower production and the McClellan-Kerr Arkansas River Navigation System. The recommended study would examine the immediate (or active) floodplain of the river and the existing water resources features and assess the need for projects to improve habitat, recreation, water supply, and other uses.

Lead Organization and Partners: USACE would lead the study with participation from state and federal agencies in Arkansas, Oklahoma, Kansas and Colorado.

Needs Addressed: This recommendation directly addresses the need for better Tributary Management. This recommendation will be important in addressing needs for Water Quality, Sediment, and Floodplains and may provide opportunities to meet the need for more Bicycle Trails.

Cost: This study would be expected to cost between $5,000,000 and $7,000,000.

Value: The Arkansas River is the largest tributary of the Lower Mississippi River. Five states: Arkansas, Oklahoma, Texas, Kansas, and Missouri are dependent on the McClellan-Kerr Arkansas River Navigation System (MKARNS). Arkansas is a Top Ten State for producing sorghum, soybeans, cotton, and livestock; and the number one producer of rice. These foodstuffs are transported on the MKARNS. The watershed contains two National Forests, multiple National Wildlife Refuges, and thousands of acres of wetlands and pristine bottomland hardwood forests. It provides habitat for several federally listed endangered species including interior least tern, pink mucket mussel, and fat pocketbook mussel, and wood stork. This study would address Arkansas Game and Fish Commission concerns about fish passage, specifically for American eel, on the Arkansas River.
River Name: Ouachita River

River Location: The Ouachita River originates in Polk County, Arkansas, and flows 510 miles in a southerly direction to Jonesville, Louisiana, where it converges with the Tensas and Little Rivers to form the Black River. The Black River meets the Red River 41 miles south of Jonesville. About 28 miles below the mouth of Black River, the Red River comes to a junction with the head of the Atchafalaya River and the western end of the 7-mile-long Old River, which historically linked these rivers to the Mississippi River.

Specific Proposal: Ouachita River basin is one the most environmentally, economically and culturally diverse watersheds in the entire Mississippi River Watershed. It covers 19,000 square miles across south-central Arkansas and north-central Louisiana. Fifty-nine percent of the watershed is forested and twenty-nine percent is agricultural land. It contains one National Forest, three National Wildlife Refuges, twelve Arkansas Wildlife Management Areas and four Louisiana Wildlife Management Areas. Major cities include Hot Springs and Camden, Arkansas and Monroe, Louisiana. The Ouachita River basin contains a wide range of water resources infrastructure and provides a unique opportunity to demonstrate a watershed-based Integrated Water Resources Management (IWRM) budgeting approach consistent with the National Watershed Vision.

Lead Organization and Partners: USACE would lead the study with the Ouachita River Valley Association.

Needs Addressed: This recommendation directly addresses the need for better Tributary Management. This recommendation will be important in addressing needs for Water Quality, Sediment, and Floodplains and may provide opportunities to meet the need for more Bicycle Trails.

Cost: $3,000,000

Value: The study would develop a strategic plan for the Ouachita River Watershed to prioritize activities within the basin. Water resources problems include flooding of urban and rural properties. Bank caving along the river is endangering levees that provide urban and rural flood protection. During October 2009, high flows were threatening levees in several locations. Future bank caving could cause levee failures or significant damage to public infrastructures adjacent to or located on the banks. These damages could lead to significant flooding of area development and/or potential loss of life. Significant problems with navigation on the Ouachita River have been experienced in recent years because authorized cutoffs were never constructed and the existing radius of bendways above Monroe, Louisiana, is too small for tows to make the turns without "light loading" of barges. This study would address Arkansas Game and Fish Commission concerns about fish passage, specifically for American eel, on the Ouachita River.
## APPENDIX B

### Conservation Reaches

Reach #1: Wolf Island to Island #8

River Miles: RM 946 – 910 (36 miles)

Description: The upstream end of the reach is located eight miles below the confluence with the Ohio River and extends 36 miles to below the Bend of Island #8. Two large side channels (i.e., Wolf Island Chute and Bend of Island #8) highlight this reach, plus one tributary (i.e., Obion Creek in KY), several crossovers and one large river bend; numerous smaller secondary and tertiary channels, sloughs, and other backwaters, seven dikes fields (16 notched dikes), and 12 revetments. The distance between the levee on the west side and the bluff on the east varies 2-8 miles. Island #8 is about two miles wide.

T&E Species: Wolf Island Chute supports one of the highest concentrations of shovelnose sturgeon in the upper part of the Lower Mississippi River. Pallid sturgeon are frequently captured in this area as well. Island #8 also supports both shovelnose and pallid sturgeon, as does this entire reach. Six active interior least tern colonies have been observed in this reach. This reach is potential habitat for Indiana bat. Bald eagles frequently nest in and near this reach.

Public Access: Six boat ramps provide access to this reach, plus an additional boat ramp located about 5.5 miles upstream from the reach.

LMRCC Projects: 12 projects have been identified in this reach:

- Create, rehabilitate, and diversify secondary channels (6 projects)
- Enhance main channel habitat diversity (5 projects)
- Restore and diversify floodplain water bodies (1 project)

Project specifics noted on map:

- KY5: Putney Bend Dikes - Enhance main channel habitat diversity
- MO10KY13: Bend of Island 8 - Create, rehabilitate, and diversify secondary channels
- MO3KY4: Islands 2,3, and 4 - Create, rehabilitate, and diversify secondary channels
- MO4: Near Belmont Revetment - Enhance main channel habitat diversity
- MO5KY8: Channel Behind Wolf Island - Create, rehabilitate, and diversify secondary channels
- MO7: Seven Island - Enhance main channel habitat diversity
- MO8: Old and New # 7 Chutes - Restore and diversify floodplain water bodies

Completed or Underway Projects:

- KY11MO9: Three State Towhead/Island 7&8 - Create, rehabilitate, and diversify secondary channels (completed)
- KY9: Lower Wolf Island Bar - Create, rehabilitate, and diversify secondary channels (completed)
- KY7: Wolf Island Secondary Channel - Create, rehabilitate, and diversify secondary channels (underway)
- MO2: O'Bryan Towhead/Pritch & Dikes - Enhance main channel habitat diversity (underway)
- MO6: Moore Island - Enhance main channel habitat diversity (completed)

Prepared by LMRCC 06/Oct/2014
Reach #2: Hatchie River to Loosahatchie

River Miles: RM 775 – 736 (39 miles)

Description: This reach extends from just above the Hatchie Towhead dike field downstream to include Hopefield Dikes. Over 10 dike fields, numerous crossings and pools, side channels, old bendways, and wide overbank areas between west levee and east bluff (2-9 miles). In addition, there are three tributaries/river mouths in the reach (i.e., Hatchie, Loosahatchie, and Wolf Rivers). Habitat restoration efforts have been conducted on the Loosahatchie Bar (e.g., dike and closure notching), across the river from Memphis, with pre- and post-project surveys and biological assessments. Meeman Shelby State Park and Fort Pillow State Park both border this reach, and the Lower Hatchie National Wildlife Refuge and JM Tulley Wildlife Management area are adjacent to it.

T&E Species: Eight active interior least tern colonies and fat pocketbook mussel shells have been observed. The reach has good potential for pallid sturgeon and Indiana bat.

Public Access: There are boat ramps at Richardson Landing, Memphis Riverfront, and Meeman-Shelby State Park.

LMRCC Projects: 17 projects already identified in this reach and includes dike notching, tributary/mouth restoration, wetland complex restoration, and lake level stabilization.

- Create, rehabilitate, and diversify secondary channels (8 projects)
- Restore and diversify floodplain water bodies (2 projects)
- Augment aquatic connectivity with the floodplain (4 projects)
- Tributary enhancement (3 projects)

Project specifics noted on map:
- AR11: Brandywine Chute - Create, rehabilitate, and diversify secondary channels
- AR9: Dean Island Landing - Restore and diversify floodplain water bodies
- TN16: Sunrise TH/Isl 34 Acquisition - Augment aquatic connectivity with the floodplain
- TN18: Mouth of Hatchie River Acquisition - Tributary enhancement
- TN20: Island 35 / Densford Bar Acquisition - Augment aquatic connectivity with the floodplain
- TN21: Thweatt Chute - Create, rehabilitate, and diversify secondary channels
- TN22: Shelby Forest Lakes - Augment aquatic connectivity with the floodplain
- TN24: Islands 40 & 41 Chute - Create, rehabilitate, and diversify secondary channels
- TN32AR14: Mosquito Lake Complex - Tributary enhancement

Completed or Underway Projects:
- AR10: Corona Lake - Restore and diversify floodplain water bodies (underway)
- AR12: Redman Point Bar - Create, rehabilitate, and diversify secondary channels (completed)
- AR13: Loosahatchie Bar - Create, rehabilitate, and diversify secondary channels (completed)
- AR8: Lookout Towhead - Create, rehabilitate, and diversify secondary channels (completed)
- TN17: Hatchie River Mouth - Tributary enhancement (underway)
- TN19: Richardson's Landing Dikes - Create, rehabilitate, and diversify secondary channels (underway)
- TN23: Hickman Bar/ Randolph Point - Create, rehabilitate, and diversify secondary channels (completed)
- TN25: Robinson Crusoe Island - Augment aquatic connectivity with the floodplain (completed)

Prepared by LMRCC 06Oct2014
Reach #3: Island 62/63 Reach

River Miles: RM 650 – 618 (32 miles)

Description: From just above Kangaroo Pt. Dikes to the crossing below Island 67 Dikes lays a diverse ecosystem. Two prominent features include the Jackson and Sunflower cut-offs that formed DeSoto and Mellwood Lakes (e.g., oxbow lakes). Also included are large tracts of bottomland hardwood forests within the batture, and several secondary channels, river crossings and pools, old bendways, and wide overbank areas which extend 2-12 miles between the levees. Dikes have been notched at Island 63, Kangaroo Pt., and Below Ludlow, along with pre- and post-construction surveys.

T&E Species: Ten active interior least tern colonies and fat pocketbook mussel shells have been observed. The reach has good potential for pallid sturgeon.

Public Access: Access from the boat ramp at Island 63 Chute.

LMRCC Projects: 15 projects have been identified in this reach, including dike notching, lake restoration, and secondary channel restoration/habitat enhancement)

- Create, rehabilitate, and diversify secondary channels (9 projects)
- Restore and diversify floodplain water bodies (5 projects)
- Improve recreational access (1 Project)

Project specifics noted on map:

- AR24MS18: Horseshoe Lake - Restore and diversify floodplain water bodies
- AR27: Island 64 - Create, rehabilitate, and diversify secondary channels
- AR28MS22: Sunflower Dikes - Create, rehabilitate, and diversify secondary channels
- AR29MS24: Sherman Chute - Create, rehabilitate, and diversify secondary channels
- AR30: Mellwood Lake - Restore and diversify floodplain water bodies
- AR31: DeSoto Lake - Restore and diversify floodplain water bodies
- MS23: DeSoto Lake - Restore and diversify floodplain water bodies
- MS81 Island 67 - Create, rehabilitate, and diversify secondary channels
- MS86AR61: Jackson-Sunflower Cutoff - Restore and diversify floodplain water bodies
- MS92: Stovall/Old River-Clarksdale - Improve recreational access

Completed or Underway Projects:

- AR23: Kangaroo Point - Create, rehabilitate, and diversify secondary channels (underway)
- AR25MS19: Island 62 - Create, rehabilitate, and diversify secondary channels (underway)
- AR26MS20: Island 63 - Create, rehabilitate, and diversify secondary channels (complete)
- AR32: Below Ludlow Dikes - Create, rehabilitate, and diversify secondary channels (underway)
- MS21 Near Chute of Island 63 - Create, rehabilitate, and diversify secondary channels (complete)

Arkansas
MISSISSIPPI
Phillips County
Coahoma County
Bolivar County
Desha County
Reach #4: Arkansas River

River Miles: RM 599 – 556 (43 miles)

Description: Beginning at the mouth of the White River, this reach extends 43 miles to Choctaw Bar Chute. This complex reach is rich in diverse ecosystems, which encompasses the Caulk cut-off that formed Lake Whittington, one of the larger batture lakes in the lower Mississippi River. Also included are several secondary channels, river crossings and pools, and old bendways. A large expanse of floodplain is contained within this reach, ranging from 4-13 miles between the levees. Dike notching along with pre- and post-project surveys have been conducted at Below Prentiss and Catfish Point. Great River Road State Park is located in this reach.

T&E Species: Nine active interior least tern colonies have been observed. The reach has good potential for pallid sturgeon.

LMRCC Projects: 14 projects already identified in this reach, including secondary channel restoration, dike notching, lake restoration and gravel bar conservation

- Create, rehabilitate, and diversify secondary channels (6 Projects)
- Enhance main channel habitat diversity (3 Projects)
- Restore and diversify floodplain water bodies (4 Projects)
- Improve recreational access (1 Project)

Project specifics noted on map:
- AR37: Montgomery Towhead - Enhance main channel habitat diversity
- AR38: Lake Beulah - Enhance main channel habitat diversity
- AR39: Swan, Deep & Ozark Lakes - Restore and diversify floodplain water bodies
- MS30: Concordia Island - Restore and diversify floodplain water bodies
- MS31: Old White River Chute - Create, rehabilitate, and diversify secondary channels
- MS35: Gravel Bar near Catfish Point - Enhance main channel habitat diversity
- MS87AR62: Caulk Cutoff - Restore and diversify floodplain water bodies
- MS93: Lake Whittington - Improve recreational access

Completed or Underway Projects:
- AR36: Victoria Bend - Create, rehabilitate, and diversify secondary channels (underway)
- AR40: Chicot Landing - Create, rehabilitate, and diversify secondary channels (complete)
- MS32: Terrene Dikes - Create, rehabilitate, and diversify secondary channels (underway)
- MS33: Below Prentiss Dikes - Create, rehabilitate, and diversify secondary channels (complete)
- MS34: Catfish Point Dikes - Create, rehabilitate, and diversify secondary channels (complete)
- MS83: Lake Perry Martin - Restore and diversify floodplain water bodies (complete)
Reach #5: Worthington-Pittman

River Miles: RM 524 – 490 (34 miles)

Description: This reach begins above Kentucky Bend and extends to a short distance above Lake Providence, LA. These 34 miles of the LMR encompass a diverse and complex mix of habitats including chutes/side channels (e.g., Cornfield Chute, Moon Chute, Matthews Bend, Caroline Chute, Bunches Cutoff, Old River Chute), floodplain lakes (e.g., Snag Lake, Gassoway Lake, Doe Lake, plus many borrow pits), Old River oxbow, islands, wide expanses of batture (e.g., Island 88, Worthington Towhead, Sara Island, Cracraft Towhead, Pittman Island, Duncansby Towhead, and Wilson Point), numerous wetlands, and extensive forested areas and agricultural fields. The reach also includes dike fields, crossovers, and river bends. It encompasses two cut-offs (Worthington and Sarah) with levees set back creating a diverse floodplain with bottomland hardwood forest, large lakes, and other water bodies. In this reach, there are 2-9 miles between the levees.

T&E Species: Six active interior least tern colonies have been observed in this reach and it has good potential for pallid sturgeon.

Public Access: Boat ramps provide access to this reach.

LMRCC Projects: 18 projects already identified in this reach.

- Create, rehabilitate, and diversify secondary channels (10 Projects)
- Enhance main channel habitat diversity (1 Project)
- Restore and diversify floodplain water bodies (1 Project)
- Augment aquatic connectivity with the floodplain (5 Projects)
- Improve recreational access (1 Project)

Project specifics noted on map:

- AR53: Oakes - Create, rehabilitate, and diversify secondary channels
- AR54: Matthews Bend - Augment aquatic connectivity with the floodplain
- AR56: Leota Dikes / Carolina Chute - Create, rehabilitate, and diversify secondary channels
- AR57: Island 88 - Augment aquatic connectivity with the floodplain
- AR58: Lower Cracraft - Create, rehabilitate, and diversify secondary channels
- AR59: Island 89 & Gassoway Lake - Create, rehabilitate, and diversify secondary channels
- AR60: Cornfield and Moon Chutes - Create, rehabilitate, and diversify secondary channels
- LA1: Bunch's Cutoff Boat Ramp - Improve recreational access
- LA3: Old River - Augment aquatic connectivity with the floodplain
- LA4: Wilson Point Dikes - Create, rehabilitate, and diversify secondary channels
- LA47: Sara Cutoff - Restore and diversify floodplain water bodies
- MS41: Longwood Chute - Augment aquatic connectivity with the floodplain
- MS42: Gravel Bar near Carolina Chute - Enhance main channel habitat diversity
- MS43: Corregidor Dikes - Create, rehabilitate, and diversify secondary channels
- MS44LA2: Brunch’s Cutoff and Old River- Create, rehabilitate, and diversify secondary channels
- MS45: Skipwith Crevasse - Augment aquatic connectivity with the floodplain

Completed or Underway Projects:

- AR55: Kentucky Bend / Island 86 - Create, rehabilitate, and diversify secondary channels (underway)
- MS46LA5: Baleshed Landing Dikes - Create, rehabilitate, and diversify secondary channels (underway)
Reach #6: Palmyra

River Miles: RM 431 – 398 (33 miles)

Description: Just below Vicksburg, MS the reach begins just upstream of Below Racetrack dikes and extends through Below Grand Gulf Dikes. Two prominent features include Yucatan Lake (an oxbow lake) and an extremely complex, wide batture (e.g., 1.5-13 miles between the levees). Palmyra, a ten-mile long secondary channel, was created from the Diamond cut-off and connects to numerous floodplain lakes. The reach also encompasses diverse ecosystems containing several secondary channels, river crossings and pools and old bendways.

T&E Species: Six active interior least tern colonies have been observed in this reach and its has good potential for pallid sturgeon.

Public Access: Access from the boat ramp at Grand Gulf and La Tourneau.

LMRCC Projects: 12 projects already identified in this reach (e.g., chute restoration, lake assessment/restoration, dike notching, gravel bar conservation and recreational access)

- Create, rehabilitate, and diversify secondary channels (1 Project)
- Enhance main channel habitat diversity (3 Projects)
- Restore and diversify floodplain water bodies (3 Projects)
- Augment aquatic connectivity with the floodplain (2 Projects)
- Improve recreational access (3 Projects)

Project specifics noted on map:
- LA16: Abandoned Channel near Palmyra - Improve recreational access
- LA17: Surplus City Boat Ramp - Improve recreational access
- LA19: Davis Island/Yucatan Boat Ramp - Improve recreational access
- LA48: Diamond Cutoff - Restore and diversify floodplain water bodies
- MS58: Togo Island/Palmyra Chute - Restore and diversify floodplain water bodies
- MS59LA18: Yucatan Cut-off Dikes - Create, rehabilitate, and diversify secondary channels
- MS60: Gravel Bar near Middle Ground - Enhance main channel habitat diversity
- MS61: Yucatan Lake - Augment aquatic connectivity with the floodplain
- MS62: Grand Gulf Dikes - Enhance main channel habitat diversity

Completed or Underway Projects:
- LA20: Coffee Point Dikes - Augment aquatic connectivity with the floodplain (underway)
- MS57: Diamond Cutoff - Enhance main channel habitat diversity (underway)
- LA49: Yucatan Cutoff - Restore and diversify floodplain water bodies (underway)
Reach #7: Lake Mary

River Miles: RM 360 – 322 (38 miles)

Description: The reach begins just above Natchez Island Dikes (just below Natchez, MS) and extends below the Lake Mary outlet and proposed Union Point dikes. Lake Mary and Glasscock Cutoff are the major habitat features in this reach. Also included are secondary channels, river crossings and pools, channels, old bendways and a wide batture that ranges 2.5-14 miles between the west levee and the high ground on the east. Three Rivers Wildlife Management Area is also located in this reach. While there are several notched dikes in the reach, there are no known surveyed reaches.

T&E Species: Four active interior least tern colonies have been observed in this reach and there is good potential for pallid sturgeon. Critical Habitat for the Louisiana black bear has been designated in the Tensas River Basin near this reach.

Public Access: Access from the boat ramp at Natchez Front and Lake Mary Road boat ramp.

LMRCC Projects: 13 projects have been identified in this reach – dike notching, improve aquatic habitat, recreational access, chute restoration, lake restoration.

- Create, rehabilitate, and diversify secondary channels (4 Projects)
- Enhance main channel habitat diversity (4 Projects)
- Restore and diversify floodplain water bodies (2 Projects)
- Augment aquatic connectivity with the floodplain (1 Project)
- Improve recreational access (2 Projects)

Project specifics noted on map:
- LA30: Natchez Island Dikes - Enhance main channel habitat diversity
- LA31: Old River Borrow Pits - Improve recreational access
- LA33: Red River WMA Road - Improve recreational access
- LA52: Glasscock Cutoff - Restore and diversify floodplain water bodies
- MS73: Carthage Point Dikes - Create, rehabilitate, and diversify secondary channels
- MS74: Chevron near St Catherine Bend - Enhance main channel habitat diversity
- MS76: Old River - Create, rehabilitate, and diversify secondary channels
- MS78: Jackson Point Dikes - Enhance main channel habitat diversity
- MS79: Inflow Lake Mary - Restore and diversify floodplain water bodies
- MS80: Lake Mary - Augment aquatic connectivity with the floodplain

Completed or Underway Projects:
- LA32: Fritz Island Dikes - Create, rehabilitate, and diversify secondary channels (underway)
- MS75: Warincott Landing Dikes - Create, rehabilitate, and diversify secondary channels (underway)
- MS77: Buck Island Dikes - Enhance main channel habitat diversity (underway)

**Reach #8**: Raccourci Cutoff

**River Miles**: RM 300 – 265 (35 miles)

**Description**: The reach begins at the upper end of Raccourci Cutoff to St. Francisville, LA. First major component of this reach is the Raccourci Cutoff and its associated batture. The cutoff extends nearly 14 miles and is connected to Monday Lake. Other lakes within the batture include Green, Sugar House, Limeless, and Shaw Lakes. Sloughs, borrow pits, wetlands, extensive forested area, islands and side channels also add complexity to this area. Second major component includes the Morganza Floodway and Control Structure that can be operated to mitigate flooding in Baton Rouge, LA. Third major component is the large expanse of batture along the east bank above St. Francisville, LA. A few small tributaries (i.e., Bayou Sara) empty into the river in this area. Wetlands, small lakes, and sloughs add habitat diversity throughout this mostly forested batture. In this reach, there are 1-10 miles between the levees.

**T&E Species**: One active interior least tern colony has been observed in this reach. This reach overlies part of the Upper Atchafalaya River Basin section of Critical Habitat for the Louisiana black bear.

**Public Access**: There is a boat ramp located about 5.5 miles upstream from the reach.

**LMRCC Projects**: Only three projects to improve recreational access were identified.

- Improve recreational access (3 Projects)

**Project specifics noted on map**:
- LA37: New Ramp near Tunica Hills WMA - Improve recreational access
- LA38: St. Francisville Boat Ramp - Improve recreational access
- LA39: New Roads Boat Ramp - Improve recreational access
